Some Facts

on

Flues & Flueways

in the

Coalfields.

Read by Mr. Smith Lyons,
Civil Engineer & Mining Engineer,
per leave of

Messrs. Lyons and Orton,
on their journey of

1879.

Jebaba Upper Mines

The Jebaba mines are about one day's journey from the nearest road at Jebaba village, from Ibadan, and 6½ days from Ogbomoso and 3½ days from Ilorin and Kiama.

The mines are owned by three Companies

Aromayan
Ilaiwolana
Ailoma (Royal)
Ikirigbaya (Royal)
Jaraya (Ilorin)
Dikwoolani (Ilorin)

Aromayan.

The Aromayan is a company of about six men, Kosa, I consists of four men; Sadzeki Ikeau, Kalaka, Mudeiwa, Ikigbaya Bunkoola, Salau Ibrazamon. The mines worked by this were opened 14 years ago and belonged to Ilorin Kaiziyo.

There are (it is said) about 15 mines and

[illegible] and [illegible] [illegible] [illegible] [illegible]

sometimes three) cakes of Anodes weighing in all about 16 tonnes; and about 3 tonnes of Anodes, which is added to the 16 tonnes in the next operation.

The Anodes when first charged are very small; and the Cathode or plate bar is often touch of the Anodes; sometimes however, they touch, as the deposition is very variable.

There is a rough draft of the wordings of the Invoice.

Walla Walla Coal Mines

The Walla coal mines are situated 2 miles southerly from a point on the main road that is 14 m. from the Spokane Falls mines and the same distance from the Hatton Latah and Rosalia.

The mines were at first worked by adventurers under grass upon the land, and were ruined by a flood. The flood stopped running at the end of eight years and the mining was abandoned. In 1879, 6 miles to the south, some Chinamen came, drove out and seem to have had insufficient capital, took up the mines and worked them for about two months and then left, no digging has been done. The mines have all fallen in and are unworkable.

The following is the section as described to me. I saw only the surface feet of coal in each.

ft.	
120	Hard gravel gray and light brown sandy soil in bed
10	Red soil earth.
30	Coal.

The roof is evidently too soft, and wooden
props had to be set every few feet. A [illegible] coal
is lying in the mouth of the mines,
water accumulated inside and made the mining
difficult. [illegible] about from
the mine, and spoiled the adjacent ice fields
and so caused expense.

The coal is black and shiny, and very
friable. It is said not to have fault of coal
even when exposed to the air in heaps for years.
Lignite or coal dust (black) is said to have
been found to have burned for three years.
There is now no coal to be seen except very
small bits that have been exposed to the weather
for years.

If mined at all, the coal should be mined
to find a place where it could drain itself. Perhaps the thickness and
quality have been exaggerated. If not, coal might pay.

Arasaki Coal Mine.

The Arasaki coal mines are on the edge of Matsue about half a ri or less northeasterly from the Kencho. Only very little mining has been done, and what was done in April 1878. There are three small drifts in a range, as it; the principal one (a) is said to be about fathoms long; and at (b), about 10 fathoms west of (a) and about 15 feet higher, two holes about 5 fathoms apart and each said to be about 3 fathoms long. All three holes appear to be on the same bed of coal, which dips at 20° 15° E.

Section observed at (a):

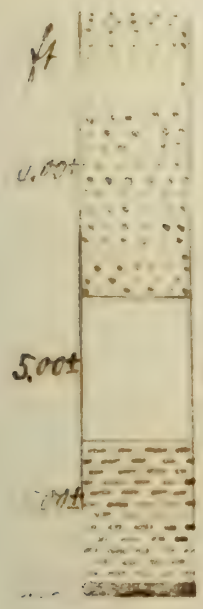
Light gray clay shales.

Coal, weathered brown.

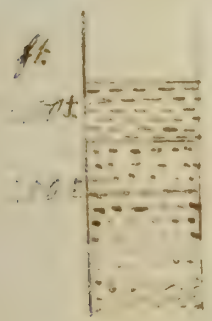
Soft greenish gray sandrock weathering light brown.

Mineral Coal Mine.

Section observed at (h):



Section at (g) (20± rods N. of E. of (f)):



Section measured at (A):

Section at (B) (2nd section 3.1 of 3):

Kulawe Pottery.

About half a mile North of the Matawa Kenaba
here is a small pottery, where a few fine articles
are made. The pottery is said to be more than
100 years old. There is but one kiln (13 fathoms
long by 2 fathoms wide) now used; but there were
more formerly. The clay comes from Matawaimbura
i Sinaragoro, (a mile North of the kilns) and
they build at the kilns and the same place
as do the Fijian potteries. (but see next page).

Ōujina Potteries.

The Ōujina Potteries are a couple of hundred yards northwesterly from the main road at the village of Ōujina about 1 ri westerly from Iwai. They are said to be 200 years old. There is one kiln 25 fathoms long by three fathoms wide, with 11 ovens; one kiln about 10 fathoms long by 2 fathoms wide, with 6 ovens; and another rather smaller kiln. There are about 100 potter's wheels here. One three bakings: the first is for the unglazed ware (suyaki); the second is for the yellow glaze (kuroguisuri) and the third is for the pale glaze. The two first bakings take about two days each and the third time much less. The clay is said to come from Hidzuru (the same as the Hidzuru of the preceding page!)

Physiognomy.

Tamadzukuri.

At Tamadzukuri, 15 chos south of Yamachi on the main road, which is about 11 miles from Matsue, there are three hot springs with temperatures from 138° F. to 147° F. One of them is in the yard of the principal hotel (Kishimoto), and the two others are close by. The locality seems to have very little historical matter in it. The springs issue from the alluvium and gravels of rough sandstone that belongs to the Kamadotan group.

At that hotel and at other houses in Yamachi and on the road eastward from Yamachi there are green jasper and smoky quartz ornaments very neatly. The stones were found in several places, near Tamadzukuri, a little south of the east side of the river there, towards Fujina and outside of Fujina, partly near (to the south of) the main road east of the Fujina pottery; but one large crystal of quartz was found on the west side of the river near Tamadzukuri. The stones nevertheless all came from rocks of the Kamadotan group.

Thermodynamics.

Among the fragments are some small hatchets
of green jasper in various stages of execution as they
are found in (ora) the ground. Samuel Jackson
the landlord of the hotel brought [illegible] of the
ancient Magdalena that have been picked up
the village, the largest about two inches long. They
are alleged to have been made by the [illegible]
[illegible] collected by the settlers [illegible].
reign on the hill near his house [illegible] the
ancient Magdalena presented. [illegible]
is about 6.11 long, 2 [illegible]
[illegible] about 6.07 long & [illegible]
[illegible] material, and [illegible] about 6.07 long
& four green jaspers,

Selenus Stratigraphy.

they have been supplied by expansion & fall of [illegible] at certain times; and the larger fissures and deep (enlarged openings in the calcareous ground and land in the river bed) are more alternately [illegible] more possible is the case. The two different kinds of ore are found in a valley. — At Hacienda Guanaxuato, [illegible] said to be very rich, but not only 0.2 & 0.3 wide it is quite unworkable.

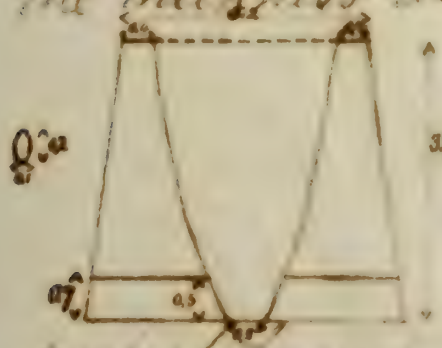
Guanajuato.

The iron works at Guanajuato are very [illegible]. They are in a high building about 50 feet square.

Batatas. — The wooden bellows (batatas), which [illegible] the name of the iron ones because [illegible] bellows is one of the principal [illegible] to be done (just as bringing in the coal) [illegible] the Mexican forges of [illegible] countries) are quite large and [illegible] worked like the Italian ones and will be [illegible] upon them. They are double, that is two [illegible] placed end to end, with the hinges at the outer ends, so that [illegible] bellows

worked by one man who stands alternately upon
their top rounds. Each top round is fixed
[illegible] and the end rails
[illegible] Each
[illegible]
[illegible] (Lancashire) is a box on
each side. The box is chiefly of [illegible] about
15 in diameter and from 3 ft 6 in to 4 ft
[illegible] and at the [illegible] is fixed
[illegible] through which [illegible]
[illegible] at the [illegible] with an inside diameter
of 6 ft 6 in, an outside one of 6 ft 9 in.

Furnace.— The [illegible] furnace is begun by
digging a hole in the ground 4 feet deep 5
ft long and 3½ ft wide, inside measure, by
[illegible] 1 ft 6 in thick made of
stones (granite and other kinds). [illegible]
bottom there is made a horizontal [illegible]
[illegible] and
[illegible] hole is filled with large stones 3 or 4 ft
[illegible] ft. Then the rest is filled with [illegible]
and [illegible] clay to a depth of [illegible]
[illegible] bottom of the [illegible] from the top. The



0.5
0.5

of the Kiln & weight of Coke on different rounds; and
it is of an elliptical form, 6 by 4 and a half
feet through these holes the progress of the
smelting can be seen at the sides of the Kiln.
Also at the middle & back end of the Kiln
and at the level of the ground there is also
the Operation Doors, a hole 2 ft square,
through which perhaps the progress of the
smelting can be observed. It will last
perhaps twenty four hours, now that hole
is closed and two other similar holes are
opened in the Square end pieces at the same
level near the corners, as by this time the
walls have become thin enough at the bottom
& below as that. When the Kiln was first
built (yesterday) it is dried by a wood
fire for one night.

The Operation. — At three o'clock A.M. in order
to getting from the end where we are working
the Kiln is filled with large charcoal, the fires
are adjusted, the coals levelled and the blast
set in motion. At the end of about two
day at five o'clock, the charcoal in the Kiln
has become a little less in bulk, and it

about 6.4 Kullcore sand at first. Then put on iron sand, perhaps 100 Kanuka, but not a weighed nor invariable quantity; then some more charcoal; and the top is made level again, and rammed with the back of the kania. Then when the fire has become again about 6.4 lower, more iron sand (about 36 kanuka) and charcoal are put on; and so on repeatedly. The first day ore and charcoal are put on about 33 times in 12 hours (nearly three times an hour); and in the following 12 hours (at night) about the same. On the second day there are about the same number of charges; but nearly quicker, so that on the third day there are 42 charges in 12 hours. On the fourth day at three o'clock A.M. (that is at the end of 72 hours), after having charged in all about 3800 kanuka of charcoal and 3800 kanuka of ore, the top the least (which has been continuous from the first handling of the charcoal, and take away the fire. Then we break up the kania, drawing out the coals that remain on the mass of metal that has been produced, and let it cool. The mass of

just like the pig

day that Mr Church the chief [illegible]
away with a small iron rod [illegible]
a hole through their [illegible]
carrying the metal masses [illegible]
near at hand, at about 6 o'clock P.M.
[illegible] pushed out, and [illegible]
to Agra. The depots are [illegible]
drawn at once into a [illegible]
(chief square) close by [illegible]
Mint Trucks of the [illegible]
afterwards broken up [illegible]
of steel dies in the [illegible]
here but at some other [illegible]
afterwards broke up [illegible]
same day that the metal [illegible]
the Rama is [illegible]
the Coins recommences. [illegible]
are therefore seven [illegible]
then occasionally [illegible]
consequence of disordered [illegible]
are about 70 operations with a [illegible]
of this number 70 [illegible]
Coined — about 2 1/2 Lacs of Rupees
in the three days operation; [illegible]

[illegible] and 1000 kanume [illegible]
down. In the case only meate is used, and
it has to be burned often, charcoal and
the ashes are gotten (a usually valuable)
mineral.— The charcoal used is very large,
some pieces two or three feet long by half a
foot in diameter but many smaller, and
it is often up a little before it is put on the
fire. The coals in the fudedoko do not diminish
it is said, not even in two days, and
when there is any interruption of the work the
fudedoko is kept warm by a mound shaped
charcoal fire on top covered with clay (2") 2
thick, except at one end where which a
few sticks of wood burn slowly.
(5) Ore.— The ore used at Kamegawa is (in part at
least) brought from a distance of over 2 miles
back, [illegible] and looks gray. It is
crushed at the furnace, and out of 50 loads,
50 loads are obtained, some ore is mined
in the hill side close by the furnace in the
winter half of the year. The rock there is re-
ckoned in [illegible] of which [illegible]
parts are worse than others and [illegible]

pretty good. [illegible] produce 500 to 1000 loads [illegible]
600 loads (of 36 bushels each) in one season
about 180 days, or 180 days' work. But that
[illegible] is reduced to one half by the
trivial [illegible] at the [illegible]. In this
season (it is said), the [illegible] and
[illegible] the rock [illegible] a length of about
30 yards by a width of about 15 yards and
a height of [illegible], the [illegible]
per cent [illegible] loads of [illegible] of
the trivial remainder about one per cent. [illegible] the rock.

The ore obtained from a vein of gneiss and
of a reddish color and so called because [illegible]
from the rock which [illegible] [illegible]
and that from the outer [illegible]
and in that order [illegible]
on the first day of the [illegible] the [illegible]
already used, and so the operation proceed
the less possible (?) ore is used. The
[illegible] under only [illegible], it is said, [illegible]
the [illegible] under one [illegible]. The [illegible]
possibility is [illegible] owing to [illegible]
presence of titanium, [illegible]

Steely quality of iron.

Yearly.— For a year with 70 operations about 1 [illegible] tonne of charcoal would be needed and 140 000 tonne of wood. (Or about 10500 coals or 252 000 tonne (or 95 [illegible]) would be smelted in the same time. [illegible] would be 630 days' labor required. [illegible] 4000 tonne of iron operation would [illegible] tonne in all for steel, but and dynite are obtained, that is about one quarter 25 per cent. There is, then, over half a great loss of iron in the slag. The product of 70 operations in the crucible would be nearly 1 ton, of steel about 1/2 tons would be good steel.

Breaking.— One steel mass (including [illegible] that I saw was of irregular block shape [illegible] feet long by about 2 feet wide and half a foot thick, including some cinders and ores on top, and slag below; and the dynite of said bloc. About the same shape but much thinner. The top surface is good steel on all sides. The breaking up into small pieces is done partly with [illegible] hammers of eight

men; and, in the case of the two-hundredweight, by lifting full upon each of these a charge of about weighing 56 pounds from a height of some ten feet. The mass is raised by means of a windlass, worked by two of these men; and takes about a quarter of an hour. The whole of the charging of a blast occupies about 2½ hours.

Labor.— Besides the furnace men at the head of the stack (with 48 days' labor), there are, for the work of each pair of bellows one man at a time; two men for the two; but in the 4 hours there are three shifts changing about once an hour), making six men in all. Besides that there are two men for the charcoal, and two for the ore; making ten men in all of 48 days' labor in the 24 hours. In building a furnace 12 men are employed for a month outside besides the ten already mentioned. There would be men in all twenty days' labor for each operation.

Prices.— The wages of the [illegible] furnace

men and steel drillers average about seven
feet a day, working one shift per day
four days. It is easy to see how expensive
the drills will become. 4 days labor at
drilling the one in the hill side would
cost half a cent a ton for final breaking, or
2 Reales, making wages by about the same
as it is worked.

The wood used comes from land that be-
longs to the Juanca mine. What there is on
their estate is gone, but the cargo [illegible]
to get to Juanca. It almost the whole
cost of the ton at Juanca. I have seen
2½ tons per to Juanca; and sometimes [illegible]
per to Juanca.

Charcoal at Juanca costs about 1 Real per
Fanega.

Ore brought from a distance is brought on
mules load of ½ Juanca. After drying it
weighs, it is worth 25 [illegible] 6½ [illegible] gubic yard of rock.
2 Reales (real plata).

The 12 kinds of Juanca ore is [illegible]
cost about $5 a ton, or about $60 in bill; but
are worth $75. Mine [illegible] of Juanca and

of the best kind (yielding 50 per cent of iron) bring about $2, 00 a ton, and $ 6 of the latter, making $ 1 of $ 16 for the whole product of 30 tons.

The making of bar iron from crude and kera coal (as it is said) is now $ 22, and with inferior ignite and kera it comes to. Bar iron is sold at Singapore for $ 30 $ per 24 kammes; that for $ 22 is the ordinary that for $ 15 is poor, the highest quality (and that is little used) is about sixty dollars a ton). Ignite bring $ 3 at Sademe.

The exact expenses of the operations of a whole year would be:

266000 kamme charcoal @ 12		$ 319
140000 " wood @ say 2½ per 1000 kamme		335
10500 loads of ore @ 25 sen		2625
6300 days' labor @ 9 sen		567
6 days for furnace building (4 men 4×7)		28
		7049

Something should be added for the wear and tear of tools and of the dwelling, deterioration of the building, cost of superintendence, and interest on the capital.

The value of the products for the season of 70 operations would be at say £10 for each operation £700 at £6 per ton £4200. It would seem therefore that at present we do not pay expenses, or make very little. The information is not quite clear enough to decide with certainty whether there is any profit or not.

Wanted.— We are in want of specimens of stone, sand and mud are especially wanted, also of plants and of clay (Kaolin). We have already some specimens of ore with quality remarked, and of "good stone" and "poor stone". In each case inferior specimens would be the most useful; but specimens of the two qualities might be added, if convenient.

Note!— The day I visited Hungarian furnace was not in blast, and the bosh was cooled off, the air was, and the pulverizer were kept warm by the Hungarian around based over it. The [illegible] is quite as it was when [illegible] [illegible] such [illegible] [illegible] [illegible]

for, it is possible the answers were not always perfectly exact, though evidently as near so as under the circumstances they could be. It will therefore be well to compare them with the calculated & the closely similar establishments of Greenwich and with the observations of the Admiralty.

Uredatara.

The lion works at Uredatara are [illegible] and [illegible] (Sauc), and are a near [illegible] they even say that [illegible] at that time [illegible]

The furnace is 4 ft 3 by 3 as they told me, and by Mr. Malachi's measurement of my sketch the mouth width at the tyer 3 ft 4 the inside 2 ft 9 in and below at the tuth 3 ft and the inside 6 ft

[illegible] there are [illegible] carbonic. The furnace house, bellows and [illegible] and the operation are [illegible] there at Sauzara, and my very best [illegible] about 4 ½ Weeks in the evening [illegible] by [illegible]

Coal [illegible] Mr. Malachi [illegible] [illegible] [illegible]

Mechanics.

2 times in the day time and about ten times in the night. On the first day the Cooling is longer and the cooling less frequent; on the third day, more rapid and more frequent. They change about once or twice in a minute; that is about once in a minute.

Reading of the Thermometer. Inside the furnace Regulator, what we call the Iron outside of the Regulator is divided by the black rules into twenty equal parts (about three feet and six inches) each of which represents about one degree.

The iron rod is charged only about the middle of the afternoon, and is charged usually about the middle of the afternoon. The rod is charged about the middle of the afternoon. The rod is charged about the middle of the afternoon. The rod is charged

would seem to be impossible as the light Magnus rise above, the winds and coals often [illegible] become unusual dynamic; but it does not [illegible] the [illegible] of the [illegible]

The [illegible] in the [illegible] is [illegible] (a [illegible]) [illegible] already (2 [illegible]). The [illegible] [illegible] [illegible]

[illegible] 720 x 20 Ramm [illegible]
and 1200 x 1334 Ramm [illegible]
and 2000 Ramm [illegible]. [illegible]
[illegible] [illegible]
[illegible] [illegible]
[illegible]

alone in the Bunge process less charcoal is needed. The kilns are about 20(18 to 21) on each side of the furnace and are a little smaller than for the ordinary charcoal. The process is started in a heated kiln by the heat of the exit gases of the furnace. In other respects the Bunge process does not greatly differ from the Seltzmann.

Remarks.

The whole cost of the wood and operation appears to be made up nearly in the following proportions:

Charcoal	1 1/4 furnace
Ore	3/4 " "

Furnace:

Clay	4
Brick & Masonry	3 1/2
Labor	1
	8 1/2

Labor:

Burning	3 1/2	
Blowing	2 1/3	
Charging	1 1/2	7
Wood & rather		100

Evidently the cost of fuel and labor are the most important items.

Much economy might apparently be made in the [illegible] of [illegible]

1° By [illegible]
2° . . . . .
3° . . . . . fluxing.
4° . . . . . furnace building
5° . . . . . drying.
6° . . . . . reducing up.

1° The second [illegible] [illegible] under more energy by the [illegible] and could method [illegible]

2° The cost of carrying the ore [illegible] and with good [illegible] [illegible] teams the cost of carriage would be much reduced. It may appear as that the [illegible] alone is not a sufficient inducement to justify a great outlay [illegible] but other roads would be [illegible] [illegible] [illegible] [illegible] [illegible]

the larger would waste for one night's time and labor in carrying his product to market. The same number of mechanics would be employed in carrying his corn to a better market, the latter would realize the difference between XXXXX 80 cents per bushel, and sixty cents, and while these wages, he could afford to pay them, it would be as well for both employer and employed.

The coal at present brought from Indiana to the American furnace is reduced nearly one half by the time it reaches its destination. If railroad freights were done away with, the cost of carriage would be reduced one half.

As the coal at present used is fifty per cent more than the ore of the last smelting, it would be cheaper to carry the finely crushed ore to the neighborhood of the coal growing places rather than to carry the coal to the ore. But coal can be carried down stream on boats that would not carry a cent of the ore. Nevertheless, ore could be carried very cheaply down stream in boats or the larger steamers with improved engines. It would seem advisable to have the furnaces near down stream to the coal region

near good coals never rather than that use the Newcastle Coals, among the Advantages that the Saving of Steel would be considerable small and the better power [illegible]. The Steel is a considerable saving in steel could be effected upon use of a hot blast; for a heated blast is so [illegible] economical with the Steel. The Steel required for heating the Steel apparatus is much less than that saved in smelting.

It is not unlikely that in places near the sea shore coke might advantageously be used instead of charcoal; but the quality of the iron would in general be inferior. The heat produced by it would be greater the quantity the furnace might be charged, and larger quantity of ore might be charged at the same time. It would however be necessary to use a hot air blast.

3d. The steel and iron produced [illegible] weight is one third of the whole weight of the ore; and the pure metal nearly three quarters the weight of iron. The loss of iron in the process [illegible] is very great, as it is also in the Catalan method.

iron goes into the slag; &c in order to separate the particles of metal in the ore it must be made possible by combining with the oxides which form a glass. The clay (silicate of alumina) by the heat of the furnace combining with the metals and the oxides would form a possible double silicate of alumina and protoxide of iron, also at the certain. In ordinary blast furnaces a great quantity limestone is charged along with the ore (which usually contains clay also) in order that a double silicate of alumina and lime may be formed in which the two bases the oxides of iron and manganese. I am, therefore limestone might also be used to advantage in the puddling furnace. Perhaps the ashes used could also as a flux (I am of no other use for which it could be specially needed); but it is a very costly thing. Many plants contain lime & alkalies especially potash in their ashes, but I am not yet aware of precise composition of the ashes of the reeds. It is known however that the ashes of iron wood. (to which the reed is nearly allied) contains a

larger proportion (about one pound) to [illegible] (about one pound) to [illegible] [illegible] [illegible]

[illegible] not a cost in the calcination [illegible] and the lime will be ready to combine with the [illegible] and again towards [illegible] reaches the point from the bottom [illegible] where the heat is sufficient. [illegible] even the separately [illegible] may come [illegible] making [illegible] [illegible] will burn near the quarry, [illegible] [illegible] point of great importance with the present bad roads where wagons cannot be used. The lime would of course be used as ready [illegible] inside before it was [illegible] acid again from the air. But in many [illegible] the lime would be a cheaper [illegible] than the ashes now are.

It is impossible to tell [illegible] suitable quantity of limestone & [illegible] without knowing more exactly the composition [illegible] and (if the kilns be built of clay) without knowing how much of the clay will [illegible] depending burden of the furnace. It would take perhaps only about twelve hours

Iron Hand Wash Stand

Inside Kitchen.

In Kitchen on the east side of [illegible] wall
is window with [illegible] and door [illegible]
from Smoke House, here is a small forge for cooking
victuals and here into wrought iron work. On I
pass through Kitchen to the Offices, and with
[illegible] in the garrison, I had no opportunity
to see the elevation myself; and was informed that
[illegible] in the Kitchen I entertained [illegible] the
whole process more conveniently at their pleasure.
Therefore I saw the five [illegible] at
Kitchen and obtained by enquiry [illegible] information
I could (though indirectly) [illegible] the details
of the method followed.

There are two large pans, each [illegible] about
about 3½ feet square that taken from [illegible]
feet above the ground opening into a [illegible]
chimney, of which piece the hood there is only
the back wall and the right side. Behind the
next wall there is for each pan a [illegible] boiler
[illegible] with a pipe and horizontal [illegible] all
[illegible] pans. The pipe is a [illegible]
reducing the [illegible] and [illegible]
the other pans [illegible]

these rooms and lead by subterranean walls. The chimney & the place of hearth is a trough like space 7'6" long (at right angles with the back wall of the chimney) 2'6" deep and 1'3" wide at the top and one foot wide at the bottom. The sides are made of mud walls about 2'6" thick, and the bottom slopes slightly forward. The tunnel (or flue) which leads from the hollows through the chimney ends at the back of the hearth and at the bottom of it and is level, and reaches forward to 1½ ft from the chimney back. That portion of the hearth was at the time of my visit full of large cinders (charcoal). The hearth is 2'3" long nearly at right angles with the back of the chimney, 1'5" wide (with at top and bottom) and one foot deep at the deepest point, which was about the middle of its length. The flue just reaches the hearth at the back end is level, (and has a diameter of 8" inside and is 2" thick (of clay covered with clay?).

The women and young girls from midnight till dawn keep a fire constantly upon the chimney & hearth, and upon that about seven flames of charcoal and then the drying is begun. In about ten hours a temper heat is found; which is maintained into a slow and

put with about the same weight of loam into the crafty fire. Each day eight blooms are wrought, and that work is completed before any of them are released in the morning. The blooms and bars of about the same weight are put together in the crafty fire and are heated and hammered repeatedly until bars are formed. The bars are 1 ft or 1 ft long by 4 inches wide and about 2 inches thick, and weigh five pounds of a hammer (about 10 lbs) each. [illegible] of about this frame is cut into four pieces both ways and with four men standing will transport hammers on a small anvil set on the ground. Being heated in the crafty fire, but and ends (ends) turned out and is beat by them in front of the hearth. Each day eight more of charcoal are used in the crafty fire. There is a measure of cubical shape two feet and a half long on each edge, and a sheep's skin bag called fifty pounds, and contributions about twenty lbs. As I understand, one shoe a day is used in the blooming fire for making the eight blooms. In all there are eight workmen two for the bellows, four for striking, one for holding

the Chisel and one for attending to the fire. Some day forty pounds of finished bars are produced.

It was stated at Kamaishi, the cost of conveying Ore and Coal to the Iron is $ 3.00 a load generally of 30 pounds of Ore, or $ 3.60 for a load consisting of 40 pounds of Coal. At Yawata $ 3.00 the contract the cost of the Iron head of the coal, $ 1.20, there remains $ 1.80 which divided among the eight men would be 22½ sen for each man, or 11½ sen more than are earned by miners. Apparently the Iron owner makes no profit, and it is not likely that he should, for the Iron requires no great capital that would need a return of interest.

The amount of Charcoal consumed at Kamaishi is enormous, no less than eleven times the weight of the Iron produced; whereas in Japan generally, according to native calculation, only one and a half or three times the weight of the Iron is needed. In Japan, too, the cost of Iron in Tokio the Ore and Coal per ton, as stated at Kamaishi, is very low considered. It may be, however, that the Ore and Coal are very impure, and that the

in might may not by any means be easy to obtain
in Lisa. The medical practitioners
in the whole had very much to do
possibly in more extensive than the possibly
of any superior part and its general benefit
in the Country, but medicine & the remedies
first in Portugal, for more convenient con-
centration of medicines and every thing
else. If Lisa however should be the
method should be employed in Lisa as
it is more the centre. But it might be some
time until the inhabitants the have heard
of it not employed and perhaps in some parts
medicines could procured.

feet high above the water. The board is about two feet long and a foot wide with a hole bored about 1½ in. from one end with a gimlet and the front edge rounded off. The board is supported sometimes by hands, sometimes by a stick fixed in the sand & the boat's stern [illegible] and filled with satisfactory material, and is then dragged along the bed of the river in the water & the heap, where it is emptied upon the bank and all the [illegible] of sand are carefully raked out. The dredger used in tidal rivers at the side of the heap is distinguished by a large leather pocket made of a circular piece of leather about a foot in diameter and shaped into a bag with a hoop at the open end attached to it by cords and is used in the same way as the other dredger. The bottom edge of the bag is filled in with a piece of wood which as it takes down the river bed & the sand & gravel passes through it is drawing. The smaller dredger used in open water like the Thames & with the heavier material remains.

In using these dredges [illegible] the boat is kept

already mentioned at Annapolis [illegible]
as that washed directly from the rock [illegible]
possible, and is still more impure & clay-like
from alluvial ground. Probably by the gradual
carrying off the particles nearest each other in the
river the mineral, more pure, is left behind
[illegible] is constantly renewed from the mass, so
that the remaining particles are of a less earthy
character. Even in the solid rock there is probably
a certain amount of weathering constantly going
on by means of the air and moisture
penetrating the minute fissures and pores of
the very crumbling mass. But in alluvial land
ground such weathering, slow as it is, becomes somewhat more complete, and the resulting addition
of clay remains which probably gives
the name, "loam", to that kind of soil.

A good deal of space has been given in this
letter to the subject of iron, because
that undoubtedly is the most important
mining question of all for us after that of
the coal fields of Mexico.

Otaka Copper Mines.

The Otaka Copper mines in Aotea are in a few hundred yards of the east bank of the Kawhia Harbour near the village of Otaka at a spot called Tawa ti and a half hour's paddle up Tawa ti by land from Maki (which is about half a mile from Kawhia). But the river is so difficult to ascend in a boat that the voyage up stream occupies six hours and a half to the village of Otaka; though it takes but three hours to return down stream. The road by land passes over hills, and is said to be extremely rough with stones.

The mines were first opened in the South Month of 1875; and were abandoned as unprofitable in the Spring of 1877. The rocks of the region look to belong to the Kawakawa Group. There are said to be three lodes and two veins. The veins are admitted to have been too thin to work with profit; but the lodes are always in fact coming upon some vein or other; so that they were supposed to be more promising. The gentlemen who are proprietors, and who formerly visited Aotea,

encouraged them in that belief that Stewart was doing wrong to work. He seems to argue that borrowed money from the bankers in order to pay the miners and get that security for the debt would come and work themselves out. I see no reason whatever to believe that the miners of Reno would be any more reliable in the future than they have been in the past. The most thorough system of lighting, drainage, ventilation, in the end they have had to pay for four years of digging upon them, and the probability is that the same number of years more digging would mean still no better result. The miners say that the mines would improve on further exploration is merely an instance of the hopefulness of human nature that is too frequently displayed at mines to weigh very heavily as an argument for such a currency as they have had much experience in such matters.

In 1875 they began mining in the 4th month. up to 30 June they produced 2213 tonnes of ore, and 435 tonnes of Copper.

Ndoro Copper Mines.

The Ndoro Copper Mines in Ngamo are about 2½ miles east of Kedgeli, and about twelve chains north-east of the village and about 200 yards from the sea-shore.

The workings are on the north-east side of a hill that rises a couple of hundred feet above and adjacent close to the sea shore. The whole face from north-east to south-west and extending inland is very hilly and mountainous, the latter rising to a high range of mountains inland.

The rock of the region here is the ancient crystalline metamorphic series, which I have referred to as part of the Kanowlee Group. In some places near the mine the rock is very much impregnated with cubical iron pyrites in small crystals. The rock is very white and in parts resembles light-green and opaque calcite.

There is said to be copper in the stone at present worked, though there is said to be another outcrop near on the road about two

It is clear from the table that while in the
early St Martin, 1875, only [illegible] names of coffee
(with only all arabas) drink about 6 lbs, it reaches
three [illegible] (including boxes) & the amount
of 6 lbs 7 oz; & that there were, now & then a case of
about 4 lbs 3 oz. The tables, however, are evidently
not quite without error; [illegible]
[illegible] some mistake in the [illegible] by which
officers and the average drink (including the
[illegible]) appeared in 1875 about 2 lbs
3 oz & the hundred names of coffee-gardens.
In the spring of 1877, about five days were
[illegible] [illegible] was only of 1877, about four days
and a half; and in the beginning of 1878 only a
little more than two days!

The ore contains, it is said, a little native tin and tungsten and from 6.4 to 6.5 per cent.

down by the pail; and the cow is evidently very difficult, and the pulse is hard and frequently rebated. At about one hour of their time, when the cows are in the act of drinking, it was found 5 strokes a minute. Many an hour after the pulse had reached 60 strokes in a minute, the pulse of the cow was then reported to have exactly the same number of strokes (about 60) and the cow was found to be in the act of drinking. The cow was then taken to the stable and the pulse was found to be 60 strokes in a minute

distance & it at sea level would be more valuable than it is in a low light house & the general [illegible] (probably not more than 40 or 50 miles); and any lighter vessels & the ships with passengers would be still nearer to the land and thus would find the signals already in various ways. The Board [illegible] would perhaps suggest and means of trading like &c; and possibly [illegible] by [illegible] the [illegible] and the [illegible] [illegible] [illegible]

Sakawa Ginzan.

Sakawa Silver mines are in Sakawamura, Kōchi which the lands of the Village of Hirose, and on the [illegible] about 3½ ri from Kōchi, and about 18 ri from Hamada.

The veins are among the rocks of Sagoro [illegible] ri from the sea shore, [illegible] ridge between Oshi and Hirose, and the top of Ginzanoyama is some 500 ft. above the sea level, and these veins stand 300 ft. higher, and the mines stand 200 ft. higher and partly much more than the village, in all 800 ft. a vertical place, 2 ri west of Sakawa.

The veins of the region are old volcanic rocks, [illegible] and [illegible] in fine hard and [illegible] and with [illegible] and chiefly composed of [illegible] granular [illegible] including also large crystals of [illegible] [illegible], and [illegible]

Chapitre premier.

yellow grain of iron pyrites. The Manx rocks are probably connected with Snowdon & Anglesea, a rather less ancient volcanic district, which may some time be discovered in a straight line to the east.

There are said to be about thirty veins, all running about east and west; and towards the east the country rocks change and the veins become less rich. Some are (it is said) many yards wide, but are poor; others are very rich, but are much wider. One of them is said to be twenty-one yards; another one hundred; and the third one hundred and ten. The greatest width of the ore worked is said to be about half a yard; and the best specimens which are shown (from the Knockrushen mine) consist of white quartz, with [illegible] of copper pyrites, and an occasional vein of the sulphuret of lead (galena) a quarter of an inch thick. The copper pyrites contain about half their weight of copper, and the galena about half its weight of lead. The veins are said to be accompanied by a layer of black rock on each side, which is called killas, and which contains a little copper pyrites. Below the level of the sea, the veins are said to be richer than above it.

87

[illegible] it is commonly not operated. The ore is in general harder than the country rock.

The mines were begun in [illegible] (some 600 years ago), and have been worked continuously ever since. They were especially famously in the Middle ages (some 300 years ago), and are said to have yielded [illegible] (one half a million dollars) yearly for [illegible] years, and 300 persons and 300 horses constantly at work. But the ore above water level has been gradually exhausted, and in the last century or half a dozen years [illegible] much money has been lost in the hopes of [illegible] new veins. A work especially to unwater and [illegible] lower water level has been [illegible] and is still [illegible] and projected. There is therefore a strong desire to [illegible] the privileges from the government. The miners present are headed by two medical students [illegible] of Freiberg. One is Mr. Adolph Hamm, who has worked the mines since 1874, & possesses a couple of hundred yards of the main lead at Himmelfahrt. The work consists of [illegible] Mr. Hamm [illegible]

a cotton dress.

At the Mission Village, and visited in the afternoon several of them at their houses, but all present only one a very small room.

The premises of the Missionaries are quite separate, but the buildings on the ground are [illegible] Village. All the [illegible] are [illegible] and [illegible] [illegible] [illegible]

There is still another process called the Le-
which they charge as much as 25 ta-

[illegible] [illegible] [illegible] [

[illegible] [illegible] [illegible] [illegible] [illegible]
[illegible] [illegible] [illegible] [illegible] [illegible]
about eight hammer at a time.

The second part of the second operation was performed by one man [illegible] by my time when they had just worked off [illegible] hammer & [illegible] until the end at 5 P.M. The [illegible] was [illegible] long: the [illegible] was a round right cone [illegible] about 2½ broad and 2½ deep fixed perpendicularly to the end of a flat iron rod about 6 f broad and about 1/2 an inch thick [illegible] a handle round [illegible] long. The other tool was a fillet of steel about 3½ long (about a foot long when used) and 2½ wide to the top of one end of which is joined longitudinally a light iron rod about 2½ feet long, with a wooden handle about 3½ inches long of which with a hammer is somewhat [illegible] rather [illegible] shaped point into the fillet. The [illegible] piece is protected somewhat upon the head of the [illegible] by a [illegible] that hangs about a foot below his eyes [illegible] a light wooden [illegible] that is [illegible] and his head.

[illegible] of the melted [illegible] [illegible]

At 5.30 the [illegible] ended and early the men
[illegible] in the furnace when many
the coals from the second part.

The [illegible] (crystallin) [illegible]
[illegible] Mr. Galachi's [illegible]

Secretion.

In the Shiga-Kruse there is said to be found a red powder, that is separated from the capsules by water, and is also in use as a medicine under the name of Shiga's, especially as a styptic for staunching bleeding wounds. It is a particularly remarkable phenomenon).

Urine.

Formerly urochrome (urophaeine Thudichum) was found, also by Shiga, but yet none have been published.

Tashilla Stone.

At Tashilla, about 2 m. from Mr. Mc Kay's house towards Hamada, there are two stones standing near each other, and a few more a little further on, in a place about 15 or 20 chains without the village. It was said to be found in the act of pulling down in a house as they are [illegible]. The stone generally worshipped is said to be used instead of ammi, and has a tail. It appears to be a Sacrificial Stone.

Tashilla Stone.

About 2m. towards Hamada from Tashilla on the Hamada road, there is, close by the road, a large [illegible] and a little out of the road there are [illegible] in the valley, an upright stone about 4 feet high, of white [illegible] black grey [illegible] heavy shale, & extremely angular fragments. Strike N 30° S 60° E. It is probably a boundary stone of Tashilla Street.

The yield of Chicago which resembles that of Kimberley about 15 c.t. to the acre. The Chicago pebbles are smaller than those of Kimberley.

The mines of Yuko are partly situated on the flat alluvial ground near the mouth of the river that flows past Tsunaki & the sea near Kaoka. The mining is therefore carried on in the wet half the year, expiring in the middle of October and ending in April, when the paddy field are not flooded. On the other hand, the carrying of the coal takes place in the summer season, while the mines are full of water; and meantime the coal is in pebbles in the open air. If the mines are kept under water they have to be pumped, and hence pumps of Kamboo are used. It is said that 5 to 6 Koku of water are raised a vertical height of eight feet in one day by 50 men, that is, 70 Koku a head Mean.

The Nanking and Kaikoku mines produce about equally, and both together about 10 million pieces (pieces = 11 kamme each) in a year. The coal mines, with about 12 000 pieces yearly, with 4 to 5 pieces up to a maximum of

Geological Survey of Japan.

Report of Progress for the year 1878, by Dr. John Milne, Geologist and Mining Engineer.

To His Excellency K. Inoue,
Public Works Minister.

Sir:

I beg to send the following report of the progress of the Geological Survey of Japan during the year 1878, its first annual report. My aim is to give here a short statement of the work that has been done and of the way the time has been spent by the assistants and myself; but to reserve the details and results of all work mainly for future special reports.

As already mentioned at the end of my report on the second year's progress of the Geological Survey of the Oil Land of Japan it was decided that from the beginning of February, 1878, our Survey should be made to apply to the geology of all Japan. Of course there was no expectation

1

whatever in any quarter that the geology of this whole country could be thoroughly ascertained within a year or two, but I feel that a long & careful, though rapid, series of observations must be made and that the maximum and minimum result could only be arrived at by the joint labors of my assistants & I trust may be spared to see my own plans carried into effect & the results in amounts and measurements can never be fully exhibited in topographical sections, shall be minutely recorded in figures. Neither the financial nor other circumstances of the empire made it probable that a very great annual outlay could for some time to come be applied to purposes that seem indeed rapidly to be more and more appreciated here, but that in spite of their great and manifold importance are then in certain quarters still thought worthy of absorbing any unexpected small portion of the whole national revenue. From these considerations it was absolutely that we must give attention more particularly to matters of directly practical advantage than to those that could only minister to

very great weight in an educational point of view. It is to be, that attacks that have a pretty direct utilitarian bearing give very simple scope for the exercise of the highest human faculties; and it may almost be questioned whether even so called "pure sciences" or "divine philosophy" would be anything better than the gratuitous of an idle curiosity or an opportunity for mental gymnastics were it not for its practical application and results more or less indirectly brought about, yet more or less clearly aimed at or kept in view. Especially in a subject so mixed & Japan as zoology was it specially advisable & urgent that we, as more immediately interested branches teaching that their study and practice would soon lead to a higher estimate of the value of the more important determinations. Our attention, therefore, has for the last half dozen years been given more especially & such zoological researches as would be of use in regard to the utility of animal products as articles of food, the coal & Glass, and the mode of life of Cetacea &c. Particularly

many other Records in Japan that now
and are well worth studying and Foreigners
desires would be extremely desirable as they
greatly assisting at comprehending English
expressions like what are at present highly
high sounding mere words. All these records
also ought to be made by a Single body of persons as
Members harmoniously working and cooperating
together and collecting as the sole receptacle
for the whole country the various detailed
notes, facts and specimens which may
from time to time be offered by occasional observers
officials or merchants, arranged and classified
so as generally easy of reference, where
these records may be examined by all
those who may be in search of information
of the whole, foreign communities excepted
by themselves.

The Japanese, then, during the past year has
been visited by many of the most powerful,
wealthy & influential Princes of Japan, and
a Japanese Lord of Kyushu who during many
generations of the whole country that had always
been ruled, with more or less [illegible]

of the general geological structure and particularly
a necessary that plans should be laid
surveys, either for immediate mining purposes
or a thorough understanding of the mineral
natural and comparative of the different
regions, especially as regards useful minerals.
Without first taking a general view of the whole
country, it would be far more likely to happen
that the relative importance of different regions
should be greatly misunderstood and perhaps
even very disadvantageously planned and
carried out. It was also possible that there
would have come under the immediate notice
of skilled, good advice might sometimes be
given on the spot in regard to means of mineral
roads. Indeed the experience of recent work
of this nature almost everywhere in this country
has shown how desirable it is that such
detailed surveys and private enquiry should be
of that kind could not be more fully met
by it did not seem possible, however, to attempt
separate reports on each of the numerous plans
and regions visited a careful consideration
of the facts observed would enable to suggest

I received by same mail a further communication and opinions of Mr. Palmer. However there is some reason to hope that from the notes of Mr. Hartley and from various papers already published, and from a number of unpublished reports, notes and facts that will be collected in our office in the course of the present summer a general account of the geology, mineralogy and mineralogy of all Japan may be prepared that will at least be much more complete and detailed than any yet made public, and that may place the important resources of the Japanese government and people and of the world at large, and many more points in a satisfactory manner, [illegible] to the [illegible].

The assistants of the Geological Survey of Japan have the same rank as the Geological Survey of the United States, namely:

Mr. T. Yamanaki, Chief Assistant Geologist.
" T. Iwasaki, Assistant Geologist.
" T. [illegible], " "
" [illegible], " "

Mr. S. Kada, Assistant Geologist.
" S. Ono, "
" S. Inouye, "
" E. Yamagawa, "
" S. Maeda, "
" S. Nishiyama, "
" K. Maeda, Accountant
" S. Akiyama,
" S. Adachi, Clerk.

The two accountants have acted in the Geology and Mining in addition to their usual duties. Mr. Adachi has during my journeys accompanied me, and assisted [illegible] in the accounts keeping. The division of the assistants into parties was the same as in the two previous years.

They have mainly confined their attention to the continuation of their researches already, but in their journeys I and Mr. Ono have made such observations as they could afford time; and Messrs Kawada and Nishiyama spent a day or two in examining the Akatani coal mines in Northern Echigo. They gave attention too [illegible]

taken up by studies connected with the oil surveys, likewise a part of the time while travelling, but the rest of the time by the more general reconnoissance.

I set out with Mr. Alcock for a visit to the Tokotomi oil survey on the 17th of April and returned on the ninth of May. (1126½ leagues, or about 2800 miles) Then we started on a long journey, first westward through Mikawa & the northern end of the Echigo oil surveys, and thence southward through Shinano, the Kwantoo, around Kwishiu, through and across Nikodu, through Kii, to Kishiu, and back by the Tookaidoo. At the end of the year we had only reached Karachi in Nikodu, and did not arrive home until the end of February, 1871. In Echigo we visited the assistants at their surveys in Kamikawa-gori and afterwards assembled them all at Nagaoka near Kizumoji, where I rested with them for three weeks in the Spring & their results.

The assistants (eight Mexican Americans and Islanders) worked in the field until 25 May and then set out for Echigo, where they worked until late in the Autumn at the surveys and

mapping begun by the different parties in 1876. Messrs. Siqueira and Barradas left the Pastoreni on field from the 16th of April & the eleventh of June, to extend and correct their survey begun the year before and after a short night under shed in Mapiri. Their work in the Sacre river between Mapiri & Consejo occupy with 20 days. Messrs Barradas and Miranda returned from Consejo on the 17th of October and the Mapiri on November; Messrs Siqueira, Gamagara and M. Macedo as well as Messrs Siqueira and Sen, on the 18th; Messrs Miranda and Henriques on the 21st; Mr. Marques on the 24th and Mr. S. Macedo on the 25th.

Field work - Surveying - In 1876 the assistants had with almost uninterrupted fair weather to mean field work & the comparative neglect of office work as they had been unable in the short following winter season to finish the mapping of all the rivers studied out; and in the summer of 1877 they had been mostly occupied in bolding & the extent of time & the hours as in undertaking the

field work of new surveys in other regions, as Deptford and Adda. In the spring of 1873, however, we had undertaken to work on the maps to establish geological theories, and although [illegible] all the observed rock exposures and the many numerous well sections that had been collected during my diligent enquiries. But in 1873 in reading Edge again (and I was the same in Deptford) the assistants found that many of the statements in regard to the depth at which oil or certain rock formations were struck in digging the wells were very inexact. The length of the fathom had been counted differently by different men, and by the same men at the different localities by the same well; and many statements had been given with apparent precision that were merely inexact remembrances of partly old wells. It was therefore impossible to make as confident a use of the well sections as had been hoped, and rock exposures were sought out with renewed zeal and enterprise, requiring much additional surveying. The early surveying (1876) was also found to be

in need of important correction in some places and a number of new lines had to be run with transit. Moreover, a good many new wells dug in the two years (1876–78) had to be registered on the maps, and recorded as fully and accurately as possible. In a number of cases the depth of wells is added and corrected by the assistants' own measurements.

Coal wells.— Our intention also at starting was, after a little additional work and mapping, to test our geological readings by some experimental digging, if necessary, and to give advice to the colonists people where they would best dig for oil; but owing to so many unexpected alterations in the beds on which our geological readings had to be done, we were not able to give such advice quite so soon as we had hoped. Nevertheless in the Shemnezadé region of Ekbatana and in Kamkabadeh the probable outcrop of the oil bearing beds has enough a considerable space been mapped out around and a few wells

[illegible] in accordance with our advice, and [illegible] have been deep enough to return an opinion have [illegible] inspired the operators with [illegible] more faith in our theory than they had in those [illegible] of years. When Scarlatini too word has come during the delay of this report that in the hands [illegible] they really have been undertaken, partly in accordance with our advice, and that the result has much increased the confidence of the [illegible] and more intelligent appreciation of the value of our work.

As the county people were about [illegible] new cases & dig the [illegible] on their own account wherever we should encourage them to do so, & [illegible] necessary for us to undertake any such [illegible] works merely for the purpose of testing the geological structure and accordingly the [illegible] did not at first go deeper than a little superficial digging & lay exposed outcrops of [illegible] [illegible] the surface. After I had [illegible] [illegible] & in the belief [illegible] & the [illegible]

by the government & instead of artesian & deep sunk wells; and the measure insisted upon, in spite of my remonstrances & explanation the circumstances were given. Accordingly deep sunk wells were begun in Jamaica, and, placed absolutely in charge of the Engineer who on their accomplishment returned to England. ~~and two of the wells have been remarkably successful.~~ At my suggestion, however, the wells were at the end of January, 1877, again removed from the Geological Survey and from my charge. It is my opinion that although the digging of wells is practicable & the country needs it, it can be but small in my report for (1877) but little so, if at all, to a responsible company (even at higher prices of pay than those that were awarded last year), and on the average results in loss to the government. We found last summer in Jamaica that the cost of well digging by a responsible company as stated in my report for 1877 was one half greater than what it cost the villagers & farmers, and it is almost absolutely unavoidable that government work should be at least

force as costly as that of a company. The government must pay higher prices for labor and materials besides the salary and traveling allowances of an special overseer and, though subject besides will be diminished of a disadvantage. The recently people in the other hand receive their own, with, can get labor and materials from their own families of land at can bargain for them at their own convenience, and have to pay no excessive prices. The produce of the two wells is on the average so much that when the cost is deducted there must surely be in general nothing but loss. There was, perhaps not unnaturally, some impatience to arrive at definite results from our survey; but there are already good direct results in our maps and above can serve as a guide to the country people in digging their wells, and if the government the work of sinking by government all succeeded in getting artesian water in this district, increased risk of increased certainty in all well digging will be a good result to the native as

diminishing the [illegible] supply
[illegible] and wealth of the inhabitants of the
Lagoons. [illegible] [illegible]
[illegible] [illegible] [illegible]
of the district) [illegible] [illegible]
[illegible] [illegible] [illegible]
[illegible] [illegible] [illegible]
[illegible] [illegible] [illegible]
[illegible] [illegible] [illegible]

Improvement of Streets — [illegible]
[illegible] [illegible] [illegible]
[illegible] [illegible] [illegible]
[illegible] [illegible] [illegible]
[illegible] [illegible]

system of having the water in a house. In the wells however, are very much (about feet and a half square) only one person can work in them at a time; and [illegible] a station up in being made, the communications made of good [illegible] which [illegible] down when the daylight is [illegible]. A pump may [illegible] of [illegible] convenience; and especially in [illegible] pumps would be [illegible] pumps connected with the well [illegible]. It seemed possible that an [illegible] pump and a steel bamboo pipe [illegible] cheap country made cords might be [illegible] which I saw in [illegible] pumps were little [illegible] and it often [illegible] only by a depth of [illegible] which have the [illegible] cheapness & [illegible] of [illegible] & [illegible] of construction that it could be [illegible] by the country carpenters and [illegible] smiths. [illegible] a small light [illegible] separate little [illegible] be made use of. [illegible]

do not give due credit to the sea, the wind does not blow equitably, the tide does not rise and fall without good effect, the winds & currents are not equally convenient, and even the direct enmity of the seas is turned to account.

Office work.— Our time in the office during the spring was chiefly taken up in plotting, especially in writing out the readings with the help of some new ones, as already described in the preceding quarterly notes in my report for 1877. The accounts were completed, as mentioned above, with a single day's delay. Between my Lofoten journey and the new survey, my time was taken up in the usual way by the office, & that report and reports if printed, particularly after the duplicates had been sent for Copies.

Lofoten Survey.— The Lofoten journey. The journey to Lofoten and back was described in my report for 1877. While there I spent a couple of days in making original sounding observations of which I have not yet published the results, namely: Vaagsø, Ofotfjord, Hamnøy, Lurøe, Andenæs, Andfjord, Nordfjord, Nordfjordbotn,

Katarburga, Magdeburg, Nuremberg, Ulm, Augsburg, and several more of these [illegible] Though all not [illegible] Places of Art & [illegible]. Among the most [illegible] and San Sebastian Library [illegible] and numerous [illegible] of the [illegible] Sculptures. The city of the Emperors [illegible] Vienna with [illegible] [illegible] in the [illegible] of the [illegible] Imperial [illegible] [illegible] [illegible]

said to be some very interesting large limestone caverns, also we found in the metamorphic [illegible] rocks, but we did not delay to [illegible] them, as, as I possibly the cave as contained [illegible] human remains, as appear often in these [illegible]. As we [illegible] Kawaiki, we had since many hours seen no [illegible] [illegible] [illegible]

& the village of Tokio, Hill in the mountains, about 2000 feet above the sea level. The first deposit used & has at present the appearance of a thin layer with shows [illegible] of quartz perhaps. Another similar deposit on, near Nara village there is still exposures of the decomposing granite and may have been succeeded by somewhat [illegible] beds of decomposing granite sandy together with which was exposed in place here and there at the top & within deep in layers. Tokio village may quartz porphyry with attraction (accidental) and, abroad in concretions, oligoclase and quartz, without mica, in a matrix of [illegible] feldspar, quartz grains, [illegible] which is often so scanty as to give the rock a faint light & [illegible] appearance. The secondary gneiss found near Nikko is of a similar rock containing besides the [illegible] and quartz an [illegible] green mineral which I take to be hornblende, which might be called a gneissic porphyry and it was said to occur in place & used as [illegible]

down from dependable. On the Sudo
road a very few minute grains of yellow iron
pyrites were seen in the porphyry I suppose all
these porphyries to be ancient and to belong
properly with the crystalline rocks underlying
together under the Kamweletan Group. On the
Ungongi road I had also seen pebbles and ex-
posures of hard dacitic (?) [gray andesitic] rock
bearing [glassy triclinic feldspar (probably oligoclase), dark green
pyroxene and magnetite in a grayish black matrix that was
sometimes vesicular. On the Ungongi road
from Kafu's village to the [the] top of the ridge
the specimens were of [dacitic] porphyry [clay slate]
(sometimes with imperfect cleavage), like the
slate near Kamweshi and elsewhere among
Kamweletan rocks. At the narrow transverse
ravine the rock is again the dacitic porphyry,
abounding with quartz in grains
& often also in a white feldspar mineral.

[illegible] Footsteps also many, [illegible]
[illegible] made at the watershed [illegible] of black slate;
a circumstance that was noticed [illegible]
back near Nyoso. Similar pebbles noticed

sketches in the journey (see frequently pp.)
and conversed with elderly ladies who remembered
nearly forty years ago. An account is found
in my native register (see Mass. Hist. Society of
Massachusetts pp. 667 and 677–9) which
legend has more recently been found to
[illegible] [illegible] strengthen my suspicion that
many if not all of the [illegible]
of the Kennebec [illegible]
[illegible]

The [illegible] of the [illegible] of [illegible] years
shall that in any case the [illegible] of the
[illegible] is never [illegible] the [illegible] that [illegible]
the [illegible], yet the [illegible] that [illegible] appeared
between the main [illegible] and the [illegible]
could rather adjust to [illegible] the [illegible] of a
[illegible], [illegible] [illegible] [illegible]
and [illegible] with the [illegible] of the [illegible]
[illegible] [illegible] on the [illegible].
But the [illegible] are [illegible] [illegible] and [illegible]
[illegible] covered; so that the [illegible]
is a little [illegible].

Indian [illegible] have been [illegible]
ever since 1616. They are in two [illegible], of

and run generally northeast

with a very little black oxide of copper

other names are all superior and only three of them are visited by the Hare, except a score of names which on their own accounts other Hares that are said to [illegible] a [illegible] of a [illegible] visit. [illegible] [illegible] [illegible]

~~Bitter~~ Blister copper made in the district of Swansea in the year 1787 was 5938 Tons (4450 cattle), which would have been 41/2 per cent. of the whole made in the three kingdoms (132,000 Tons), there is other copper particularly Bitter, which is copper used that is of a very inferior quality to that made from Swansea ore (Cornish ore) which would have been 1/4 per cent. of the whole made in the three kingdoms, which would almost entirely disappear. At the copper refiners Bristol &c. in 1787 (Cornish ore, Swansea, Lancashire) there was of Bitter and Blister copper ore refined, the quantity of Bitter copper to the Blister ore refined does not bear much more than one to four.

Bitter copper, that is produced from Blister copper at Swansea in the district which is 5938 Tons there are only 1/4 of which is Bitter copper at most 2500 Tons (3,000 tons), which is produced, is all the Bitter that was smelted. The Blister copper is sometimes called tough cake copper from its toughness, and when it is drawn into wire it is called wire bar. The Bitter copper is called Bitter because it is brittle, and when drawn into wire it breaks very easily, and is called Bitter.

(400 hammocks inclusive of 777 Kanakas) a month. The
~~Master~~ captain was also part owner of the vessel
and received $250 dollars and a half a pound and
the chief officer received $40 dollars per
month. The barque, when I first saw her
(which was soon as could be ascertained
owing to $1150) appeared to me to be
of about 350 tons burden and
that I received a very different account
of her size from the owners (viz 250 tons)
which I afterwards found to be correct
as I measured her myself.

Again, each man is paid by the day
in money according to his rank in the ship
at 6⅔ cents, or in all 26⅔ cents, and for these
are estimated the cost of subsistence only
during the whole days work or 20 hours, not
including Sundays and feasts and special rewards
for good work &c. The carpenter and boatswain
receive the same as 1⅔ cents a day. In the
latter case, as stated above, the men are paid in

comparatively [illegible] a length of
[illegible] and 2½ [illegible] a
[illegible] and in hard rock so as to
save [illegible] and in addition [illegible]
[illegible] and [illegible] are [illegible] as in the
[illegible] day. [illegible] [illegible] [illegible]
at least [illegible] and [illegible], [illegible] the
cost of [illegible] and the [illegible]. [illegible]
than the cost of [illegible] and [illegible]
[illegible] [illegible] [illegible] [illegible]
[illegible] [illegible] [illegible] [illegible] and
[illegible] [illegible] [illegible] [illegible] and

to the piece) 5×4×6.25×½×250×.24×⅝×3/400×7=[illegible]
in which a copper vessel is placed and a block
of wood 4 by 4, a piece of lead or stone with
the weight [illegible]. [illegible] in the
[illegible] that a piece of about a
quarter of a yard square is maintained as
an offering by any village [illegible] the river
continually one half or more of [illegible] in
the [illegible] months, decreases in any of
the others. It seems therefore [illegible]
that [illegible] present prices [illegible]
back and rock cannot be [illegible]

It returned to Sukkur and settled [illegible]
[illegible] Major Jacobs upon, and
began and [illegible] (fair [illegible]
of the people and [illegible] and [illegible]
near the [illegible] must be [illegible]
[illegible] of the [illegible] [illegible]
the Indus Valley. [illegible] began to be told
about some recent [illegible] of [illegible]
[illegible] Sheep [illegible] in the [illegible]
village of [illegible], and it appears that
[illegible] had been found a [illegible] of about two
or three feet [illegible] of a [illegible]

of copper pipes with iron. The lines are very
interesting as giving that of the early Saxon;
and specimens of the ore were shown us. It is
not in the least probable that such a thing as
coin can be visited with any severity in the
very hard racked at that time. The early
several leagues yielded on a mean height
more thousands of the Spring ore, and even
a magnetic needle, by which he said there
a thin mine just wide added a hundred
fathoms from the copper mine.

At Dolaucothi we entered almost at
once the percentages again, and right up
the valley northward through Ffairfach and
Cilsant crossing the river Tywi by a ford on the
Llandeilo Road. Talsarn in Talsarn, which
the road is afterwards by not, not visited
to be a good afternoon appearance
through Talsarn (near which on my left
the Iron Age about a hundred years ago)
Llandeilo, where we saw on the opposite side
Dinefwr Park, just above the confluence
of the Tywi Meyrick and Tywi, and by good
passage a cable post a second. There

welded [illegible] and [illegible] [illegible]
the plain, but just above [illegible] [illegible]
[illegible] [illegible] a light grey sand [illegible]
shale, [illegible] [illegible], [illegible]
[illegible] [illegible] with imperfect [illegible].
I [illegible] that the [illegible] [illegible]
Shumard's and Salisa is [illegible]
in the [illegible], and the Hot [illegible] may
perhaps be regarded as that of Lab.

The [illegible] of Shumard are [illegible]
[illegible] [illegible] [illegible]
[illegible] [illegible] [illegible] [illegible]
[illegible] [illegible]. One of the [illegible]
[illegible] 45°C, and the other [illegible]
[illegible] [illegible] [illegible] [illegible]
the water [illegible] [illegible] [illegible] has a
very little gas, and [illegible] [illegible]
apparently [illegible] deposit. [illegible]
[illegible], some [illegible] [illegible] [illegible]
are [illegible] in the River [illegible],
the water [illegible], and the temperatures are
42°, 43° and 44°C. There seems to be no sulphur
in the water, and [illegible]
a very light deposit of white salt [illegible]

[illegible] [illegible] [illegible] [

Sierra, there are a few inferior springs of good water; and that there are limestone rocks.

From Sabanilla to Soco there are many quarries of rock salt of the finest crystallization, chiefly green, sometimes of a fine green gray or dark reddish gray color, but sometimes quite transparent and sometimes of angular fragments of various colors, red and reddish brown, gray, green, and sometimes yellow, and even of a fine purple color. Occurring with the rock salt are beds of gypsum, sometimes of a pure white color, sometimes yellowish, and sometimes reddish. Similar exposures are seen here and there for four leagues northward from Soco as far as the mountain chain about 3000 feet above the sea, near Sedeñana, the boundary of Bolivia; sometimes with rather angular ridges, sometimes with rounded summits. Thence northward for [illegible] by a narrow valley through Mozaya to Tamasmena, four leagues. There are similar rocks, and for four leagues northeasterly until a rather more open country and [illegible] through Rodeo and Sarima to Socabaya, one

and there like rocks were seen, and some of
these rocks stood in the midst of the water.
From Sarakina I crossed the river and went
by the most difficult road, that Giovanna
and Antonio made me take, to Stelamoustan
(supposed the principal town of Mirabello,
very little inhabited); which is situated in a
country worthy the most extensive cultivation.
From thence I rode after the same ancient crystalline rocks occur
along that road. At the river crossing at
Sarakina there were specimens of light grey
soft slaty sandstone, in nearly horizontal strata,
apparently of like age with the Jurassic Sand-
stone of the Oil Country rocks of Corfu.
It would seem to be of very limited extent,
occurring in the lower most part of the valley
near the river level. All other appearances
the road, pretty frequent, are the crystalline
& eruptive rocks of Metamorphic character.
Before reaching Stelamoustan the undulating surface,
marked & cultivated plain of Mirabello, covered with the
same ancient character as before;
remained very much [illegible]

At Chinamatta saw many native localities
& visited and found back a before on the Ashes
coffee plain. Also we were conducted
to a square gold mine about a league
distant & the last, and some specimens of
that we were brought to us. The vein
is chiefly described as [illegible] wide
and a length of about two fathoms, but in
several only about 2 or 3 C. [illegible] wide, and not by
any means regularly more than 18 inch.
At the "engine" [illegible] quartz, part of which (as
[illegible] described as about 2 cwt) they had raised
to a rock [illegible] and ground, obtaining a small
quantity of magnetic iron and that stored
a rock about 2 cwt. [illegible] of which we
[illegible] ... In the [illegible] and two were
[illegible] of the smaller sizes of gold, [illegible]
[illegible] of the little nugget; [illegible] with
[illegible] we may be [illegible] in the dust which
we [illegible] to [illegible] of one per cent. of the
[illegible]; and certainly it can hardly be [illegible]
times as much as that, one hundredth of
one per cent. There were also some [illegible]
[illegible] with the ore, and some granular [illegible]

containing a fine crystals of gypsum.
The country rock appears to be a greenish slate, of
hard texture, perfectly. Reducing the quartz
veins to the extent of about 125 lbs (15 Kilos) of ore,
I obtained about one ounce of gold by amalgamation
and cupellation, giving $12.00 to the ton, and
even if the gold were not worth more than
$10 per ton. I should not hesitate one moment in
saying that there would be no
profit in working the vein. I am told however
that the claims were originally taken up
two hundred years ago, and although they
were registered by the Crown Surveyor a few
years ago were quickly given up again.

We were conducted over the ground by a
native of Thompson called Cyrus
who lived partly with Indians, where
he cultivated a few acres of land for himself
and family. He was a very intelligent
native, and he told us a great deal about
the country. He said he knew of many veins
similar to the one we visited, particularly
one about two miles from Nicola lake
and that he knew where to find an extended vein
that was said to be very rich

red specks, and black, as by the last, but grained often xx xxx smaller by them with but a large proportion of silver. It resisted fusion, and burnished the Cupidal, and was corroded by, & stain'd purple the Nitrous and Marine xx menstrua: & by fusion the Regulus of Many Cubic.

On Barley ground from Hakendover I made an excellent Separation of the Auriferous Pyrites (Bandaids) by means of the last and very Subtle Mercury, after carefully got quite fine, by Sifting over & over again the Powder. It was a dirty greyish Powder, and [illegible] dark grey metallic and in the dry mean Standard, of the Contents of the Mine, gave a Regulus of very soft Malleable light Copper Metal in which there was very few grains of Gold. Fixed minute crystalline glassy reddish, angular and transparent Sand the Ores were also mixed with. In Lime, a high Mountain about 2 Miles to the northward of Hakendover, with Lots

found some imperfect fossil shells in clay from Wales among the rejected rock [illegible] for a layer of 30 degrees that, part [illegible] from here many expenses a [illegible], somewhat flow stained pale but rather light, even [illegible], scattering red on clays, probably of like age, hence named by the Rev. [illegible] Bunbury from Bunga expenses very poor, and have of decayed pale very light and red like the less hope. At the [illegible] [illegible] [illegible]

worth two dollars a piece at Liverpool and
Sydney, a number of others a little less and
large sizes down to Chinese at about half-a-crown.
One specimen, weighing upwards of 3 hundredweight
made, or one fountain for every person of the
city; and it was worth a little upwards of
£200 sterling. It is very plain that such
pieces of work can either be executed
cheaper or finished properly, and that for
the great object, even the cost of freightage
as it is our country, that of making it as
much as the value of the material at the
works.

We were shown over a specimen of the
fine brass and bronze castings
destined for the exhibition, which
were very well executed and finished.
One of the bronze candelabra was a little
faulty and will not be fit for exhibition,
although there were other fine bronzes.
They were the only ones there.

The Australian Museum is at present
in a small building at the corner
of Macquarie Street and Hyde Park,
Macquarie Street runs north and south,

and crumbly granite

a half mile beyond Kapuna, on Kapiua, through a country of undulating high hills, we saw no signs of any thing except occasional exposures of coarse, light brown, medium, reddish gray granite, containing a good deal of mica and very little, if any, hornblende. There were also many exposures of the light gray and white granites. About halfway, at Kapuna between it and Kaiwiki between Maunalua and Honolulu, there was a cut where a layer about a foot thick of the reddish gray granitoidy gneiss was inclined down into the hill, from both sides, in all its exposure of some ten feet in thickness. The rocks there had changed nearly clear and black, and the soft red portion of each of the alternating layers had in that place the appearance of a row of pebbles each. About three quarters of the way just beyond Kaiwiki there were a few exposures of hornblende and some of diabase from the latter although not visibly in contact with them.

Sigera is on a hilly [illegible] about 3 miles above its mouth. The [illegible] of the hills and [illegible] 1st [illegible] & the stone [illegible] in the [illegible] corner of the province. Sigera is here in an alluvial plain of [illegible] and [illegible] clay but on a hillside near [illegible] beyond Sigera and Sondays a league on a road from Sigera to [illegible] [illegible] of a [illegible] green [illegible] rock crystalline, pebbles, [illegible] of egg & less size [illegible] of [illegible] or a foot in diameter, a very hard [illegible] [illegible] [illegible] but none of [illegible] not black slate, in a matrix of [illegible] [illegible]. A couple of leagues further on, beyond Chera, there were exposures of reddish and greenish [illegible] [illegible] [illegible] [illegible] and [illegible] [illegible] [illegible] [illegible]

quartz, and it is used to the manufacture
of pottery near the silver mines. Specimens
of this rock have been obtained from different
places in the district generally a little indistinct.
The Kaolin crystals are of the same color as
the matrix. In these rocks are specks of
somewhat altered by the weather of mag-
nesian silicate, but in the neighboring deposits,
more perfectly seen to a full granite aspect.
It has a larger ~~quantity~~ proportion of the Kaolin copper
veins with an admixture of copper
pyrites with an admixture of copper pyrites
but at these mines there is little porphyry
but much more purely crystalline. In the
veins there is also found dark green stone
that is very calcific, partly crystalline,
so that partly in thin flat slates, and
are of a reddish and greenish dark color
imperfect ~~xx~~ ~~xxxxxx~~ containing
quartz grains and probably minute specks
of the white veins and small grains of
calcite, although an intermediate place in
the transition from quartz porphyry to syenite.
It is possible that the magnesian ~~xx~~ has
effected the change from clay stone through

(Stephanite)

water level about its greatest horizontal length
600 feet; at the next level (131 feet lower) it
was 450 feet long, & the third level (131 feet
still lower) its length at the time [illegible] feet
was not yet known but exploration & the search
for ore did not go very much beyond this point
the fourth adit; that is yielding about 3½ ounces
of one percent. in silver and 5 hundredths
of one percent. in gold had been found; and
it was feared that on the fourth level which
had not yet reached the lode there would
be no ore to speak of. The other mines
and veins near Kongsberg were found to be of
much importance.
The mines are worked
in foreign style under the guidance of Europeans
and the former irregular galleries of old
times are no longer driven, but wide and
high ones with iron rails laid. The mines
are always pumped, but the amount of
water seems to be small.
The ore dressing works and [illegible] are
close by the silver mines, and are conveniently
arranged in fine large brick buildings. There
are 75 ore stamps and 25 [illegible] of stock

and northwesterly, but others are thereto,
that Westward.

It is said that at Takaya near Waiapu
there is an old abandoned native name
but the inhabitants there are opposed
use of the Māori language and were I
land at the place a short time before we
came away. Near the entrance
of Tūranga, a small village is situated only
a league south of Muriwai, there is said
to be very old abandoned old native Vide
Cook at Tūranga, in Uawa village, a
league south, & last southwesterly, in Mura-
-wai, is said to be a very ancient native
Pā and near this are many old
graves on the hill and some near the
beach, & the inhabitants are reported to
have come from, & to have returned to
their above, Hawaiki.

On the road northerly from Muriwai
to East Cape about eight miles from the
Whakaaturiri River, there is a large
Pā on a hill, which is said to be very
ancient, the inhabitants of which
abandoned long ago, & went to live
near the

At the village of Ukiah [illegible] Mendocino, in [illegible] [illegible] [illegible]

of Gilgered from hard slaty sandstone of
which the road here, partly and also
the appearance of such rock, is made
and of reddish grey granite, to the right
for the boundary between Sajima and
Negada (some 200 feet high). Just beyond
the pass there were two or three stone cairns
Then succeeded a couple of leagues of the
same rocky and barren country (with
occasional) stony (with) rock

At about half a league from Kanor
Negada a league from Mine & the 2nd
a good road & it is said there is an old
silver mine, that is supposed to have been
worked three hundred years ago, but now
long abandoned. It was taken up again
about 20 years and worked less than a year
and abandoned again, because they did
not get & the rich part of the vein, but
they are yielded some silver. On the road
from Kanor to the mine are two or
3 coffee mills which were worked some
years, about 20 years, but it was soon found
unlikely because of the rich soil

triclinic feldspar (probably)

and magnetic in a degree, sometimes very
great, sometimes very small. Magnetic ap-
pearances of the whole rock with the horn-
blende with a mixture of pyroxene grains
and crystals included in abundance and
scaled. Very soft grey talc and rock com-
bined a small, thread like mica, more
seen on the road at the 1st stage from
Yeraga to Nooki (20 leagues from Sitka);
and coarse, massive, white pure crystal
[illegible] volcanic [illegible] on our left. At
first there were here and there also a few
appearances of trap, hard dyke rock
dykes, shales &c. of which must perhaps
fall with considerable depth; and at the dista
of Nakamura more than one of greenstone
granitic rock; and further on again a few
of red and green slate with hornblende
dyke; and after the first stage from
from Sitka none appeared on account
I saw none at all. The mountains

[illegible] at the
[illegible] and [illegible] of the Bay of Tsuruga, a league
and a half westerly of Kamaishi. Here very
bold extraordinary dark gray and greenish brown rocky cliffs
and sandy beaches, such as are to be seen
in the bays around the northern edge of
Honshiu, but Kamaishi rocks rather
resemble those of Very Port distant south
of the head over Sagami, and Kamaishi
and Matsuyama are found in the hills
here. Yamagami is in a little alluvial
plain on the shore of the bay, but Kamaishi
and Matsuyama are found in the hills
more

on the south shore of the lake he found on the west side of the spurs of the main dome large basalt columns, and higher up andesite. The lake deposit was somewhat peculiar and can be used as travelled. He speaks also of the occurrence of gilsonite (a mineral of the hydrocarbon series) near Tamatsumbi; but none are brought down here.

At Tamatsumbi there are several springs that issue from decomposed grey or light brown pasty mud and rock, in places sandy and with a good substone, apparently a decomposed trachytic rock. There are three springs within some fifty yards. One, about the usual from the river, has a temperature of 60°C. with a yield of probably fifty gallons a minute; another at the north end (Tamimura) has a temperature of 62½°C. with a like yield; and the third at the edge of the river, has a temperature of 57°C. and a yield of probably 125 gallons a minute. Another seems to have extremely little mineral matter

in it, and has no trade nor wealth, and
pays little or no tribute. Independence
of a petty one. [illegible] well.

At Tamatave and at Tamatave
Calicoes, calicoes, agate, green ware
and [illegible] are cut into small
ornaments by them. At Tamatave
& elsewhere some worked from [illegible]
coin rock are found in several
places near Tamatave, almost only
in the [illegible] of the river, beyond Fenoa,
and inside of Tamatave but in [illegible]
smoky quartz was found on the seaside
of the road near Tamatave. Most of
the ornaments are small magnetic iron
ore cut and polished in [illegible] &
ancient medal are found in the ground
near Tamatave. The wild cattle
[illegible] of this country [illegible] have been
picked up in the village, the largest about
two [illegible] & a foot long. They are of
remote origin; it is believed they have been
made by the Arabs who are therefore
esteemed and honored. [illegible] Knights.

in the temple close by there are three ancient inscriptions, one is about 0.11 ft. long & reddish chalcedony; another is about 0.07 ft. long & similar but rather more weathered; and the third is about 0.05 ft. long and green agate. They are polished, but are badly so that the guides there now know how to polish stones. The guides informed that the chalcedony are among rare but are harder than the yellow kind of which many, such agate are of equal hardness.

They showed us some obsidian that had been found near the island Oki, which is known in Japan as Oki-ishi. The stone was found in veins and little for ornaments, except for round beads.

From Tamatsukuri we went southward eight leagues over a hilly among the hills and mountains to Matsue, near the central city of the island. The road at first did not go over very high ground, but had many passes & some 400 or 500 ft. in height. Near Matsue we cross the passes

were dunes, up to some 300 or even 400 feet above the sea; and the valley at Minari is not about 700 feet high. Within half a mile of Tomakomai we came to efforts of light grey sandy gravelly light brown clayey, besides the white, and sometimes reddish, coarse and abundant sand; and sometimes very fine, a little magnetic; and such efforts returned [illegible] to the sea or the bay. The ground was sometimes hard, at last in places, but generally very clayey. Hay; and there were small grasses and. At some points near Minari, there was a large proportion of magnetic, and here and there a little magnetic sand in the road.

In the hills about Minari there are [illegible] shading places, of which however only three seem to be worthy, namely: Tomakomai, a league and a quarter easterly from Minari; Ume, the same distance and easterly from Minari; and Madibira. The last are small or not at work and are at:

the ashes have to be burnt per each operation.

The way of working the furnace has to be carried out in a succession of three periods (3 days) with equal duration of 24 hours each, and the combustion should be in advance and the degree of heat, that is to say the temperature should be the 1/3 of the heat that is needed for a furnace.

Each 8 hours time they will introduce the fuel and the operation has to be done by the furnace. The ashes which descend have to become somewhat depressed, but it does not penetrate the ashes.

The ashes produced from operation when 288 tons (Kamaran, about 8,000 lb.) of wood 30 percent as of charcoal, producing 70 tons (70,000 lb.); of which the dry ashes from 90 to 100 tons (750 to 1,000 lb.). They are about fifty operations in a year, and the different ashes in different years. They are also on July and August, and in 1911 to pass through the month of September

towers

a. one could be carried very cheaply down
river on the larger streams (still employed
navigation) it would seem advisable to
have the saw works at some distance down
stream in the larger valleys near graduate
rather than far up in the narrow
valleys among the mountains, where the
supply of power could be comparatively
small and the water power trifling.

3. As with the saw mill the manufacture should
be only carried on to such an extent as
can be done by water power during
the summer months. And perhaps of
slightly altered dimensions, so as to
be about of equal
should not be so great in actually carried
made with advantage, but the difference
could probably be made up in
lengthening.

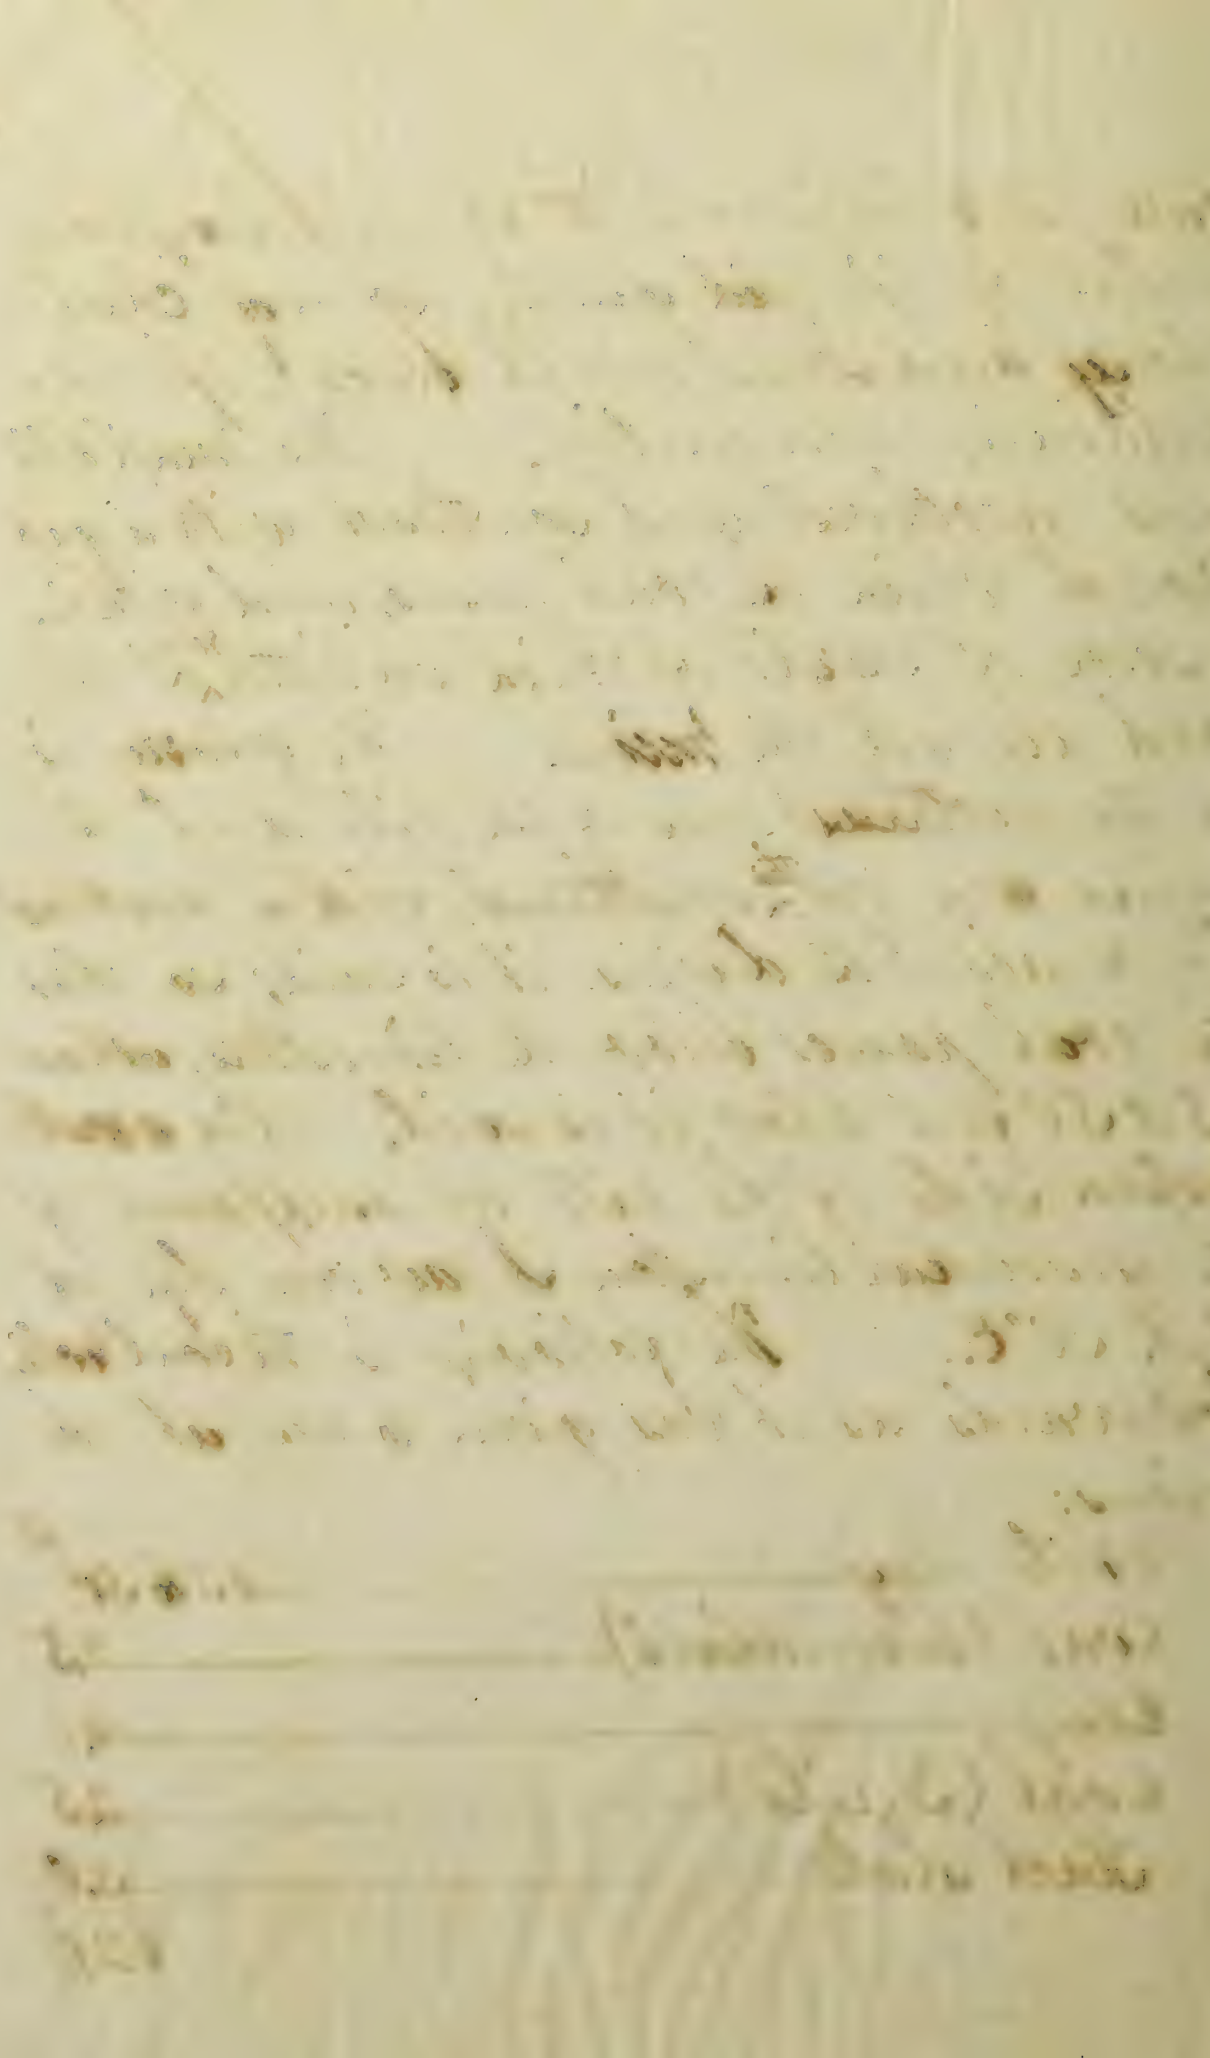
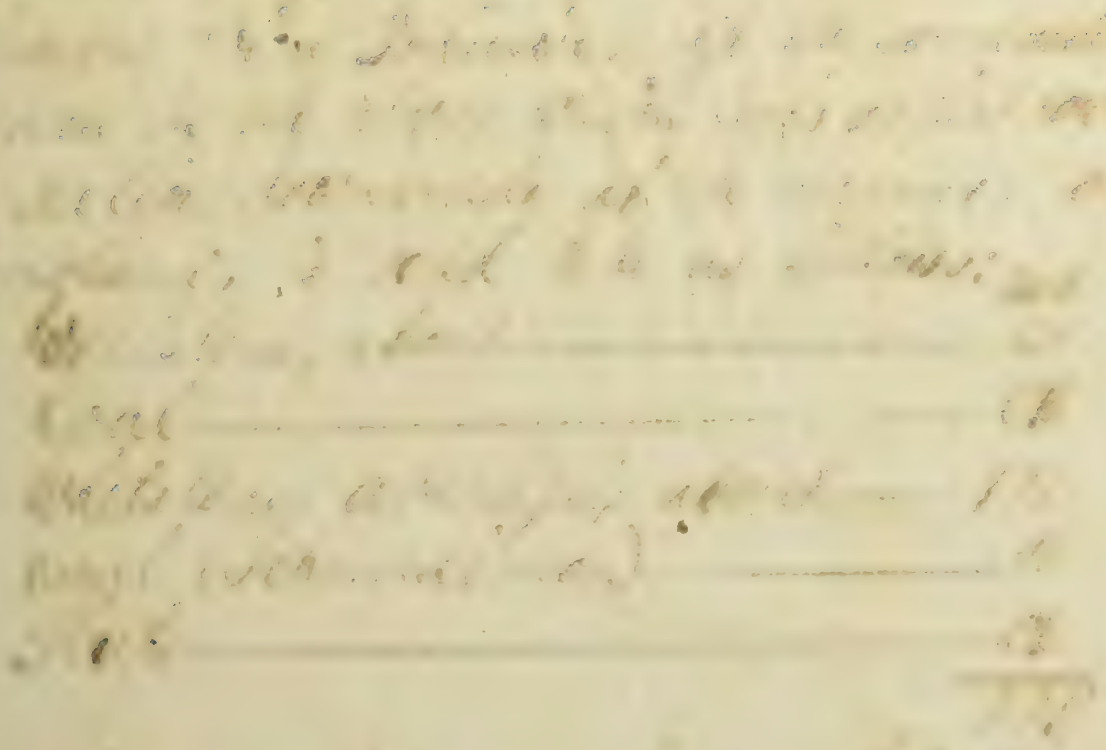
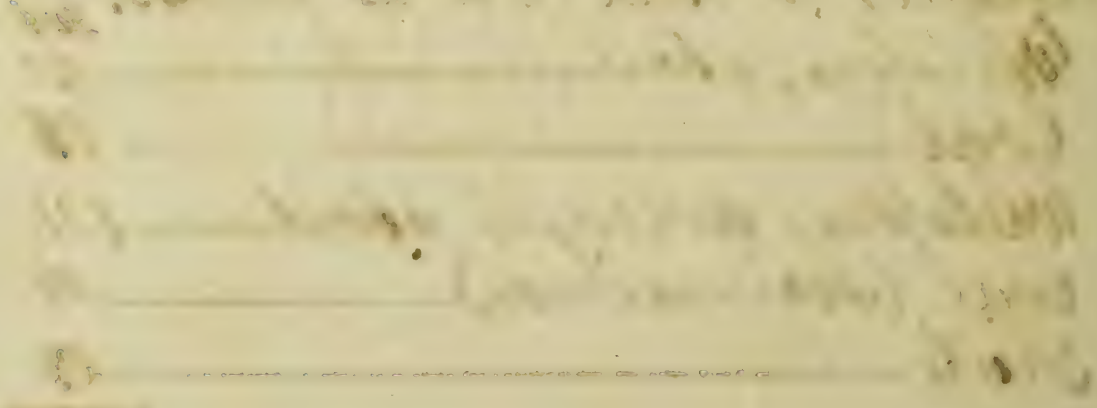
The coal is mined in the usual manner, [illegible] and coal and pillar system, but with very long [illegible] pillars.

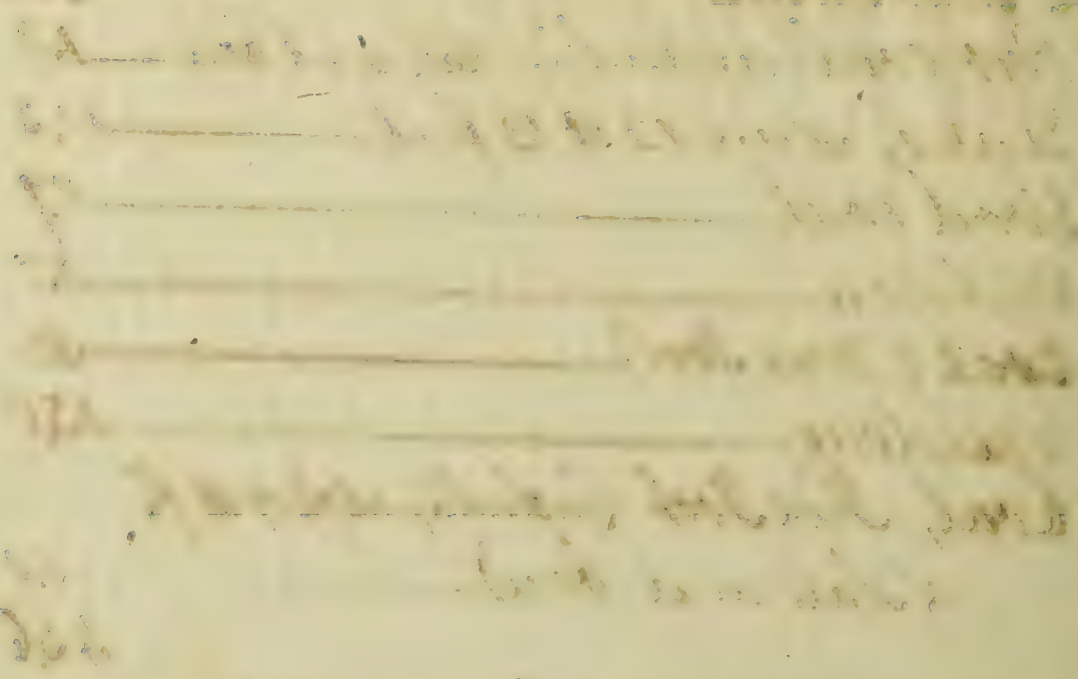


Summai

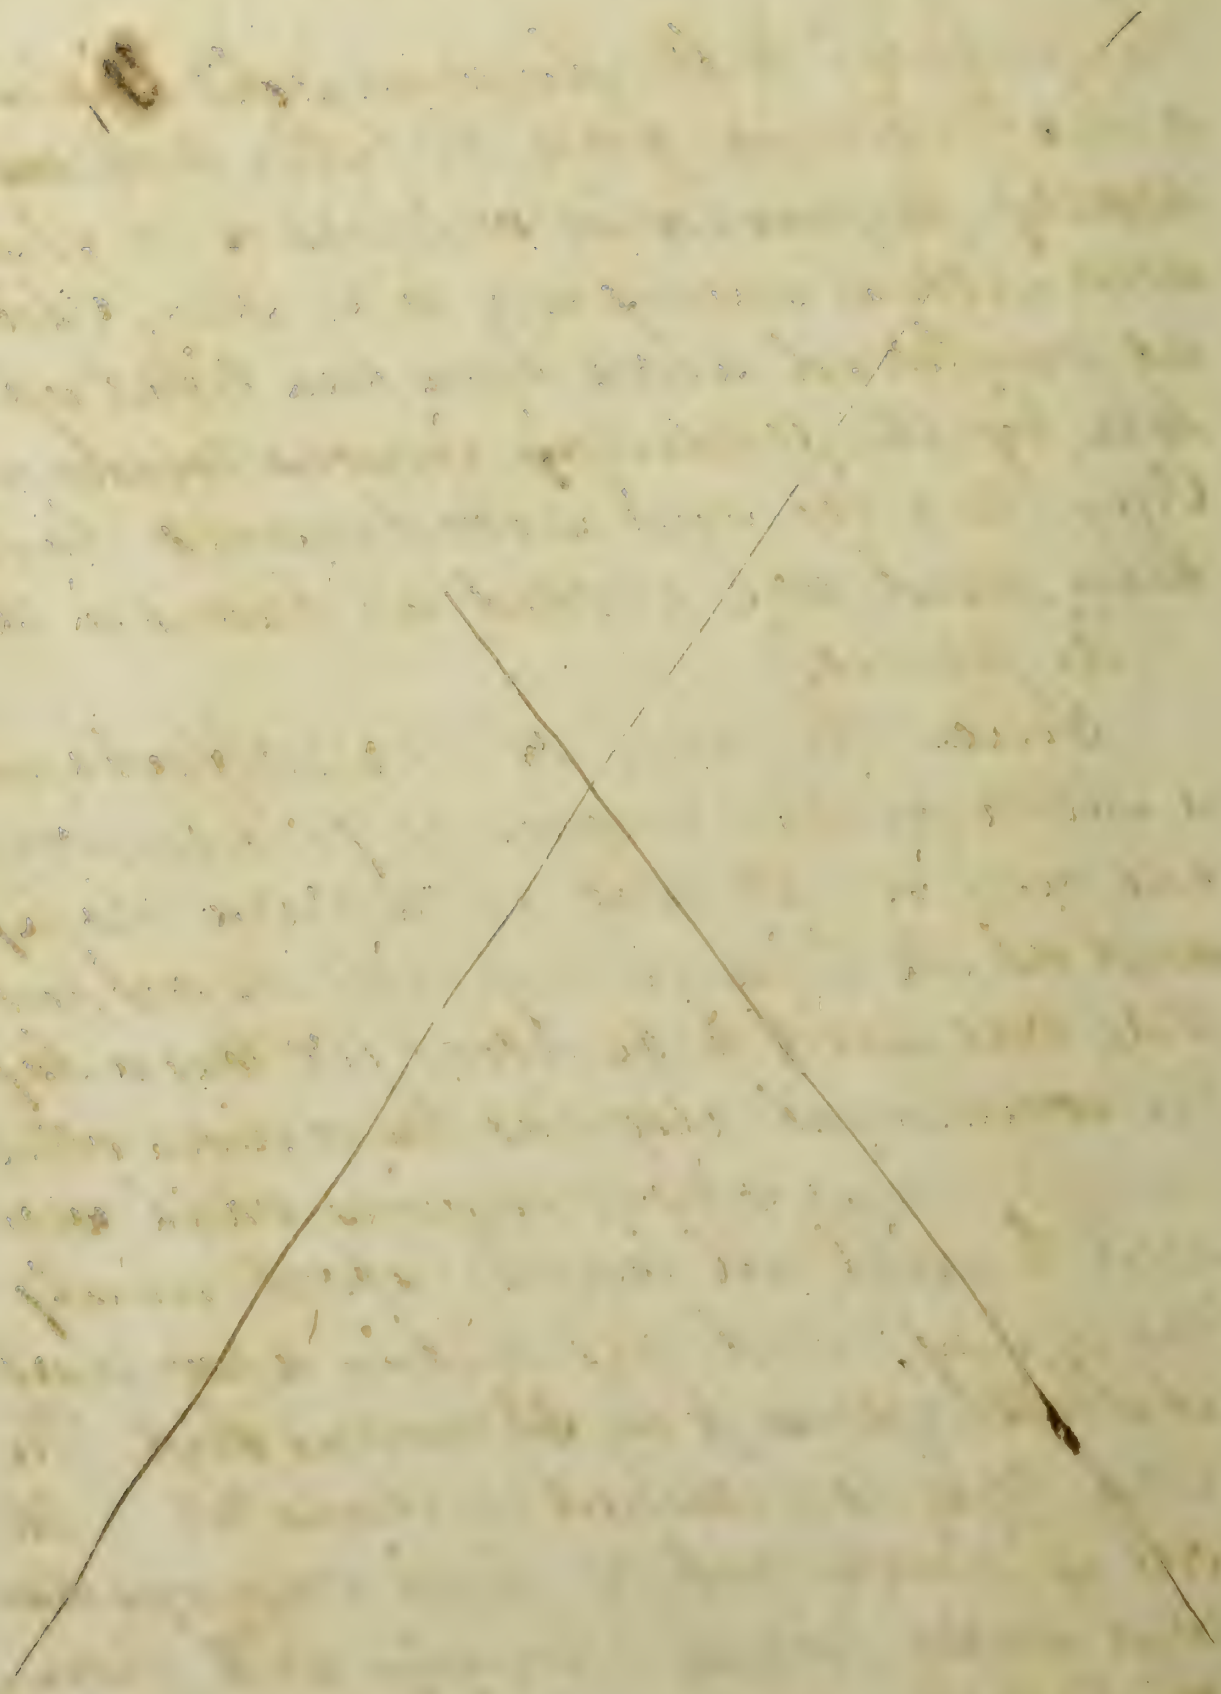
Hammer



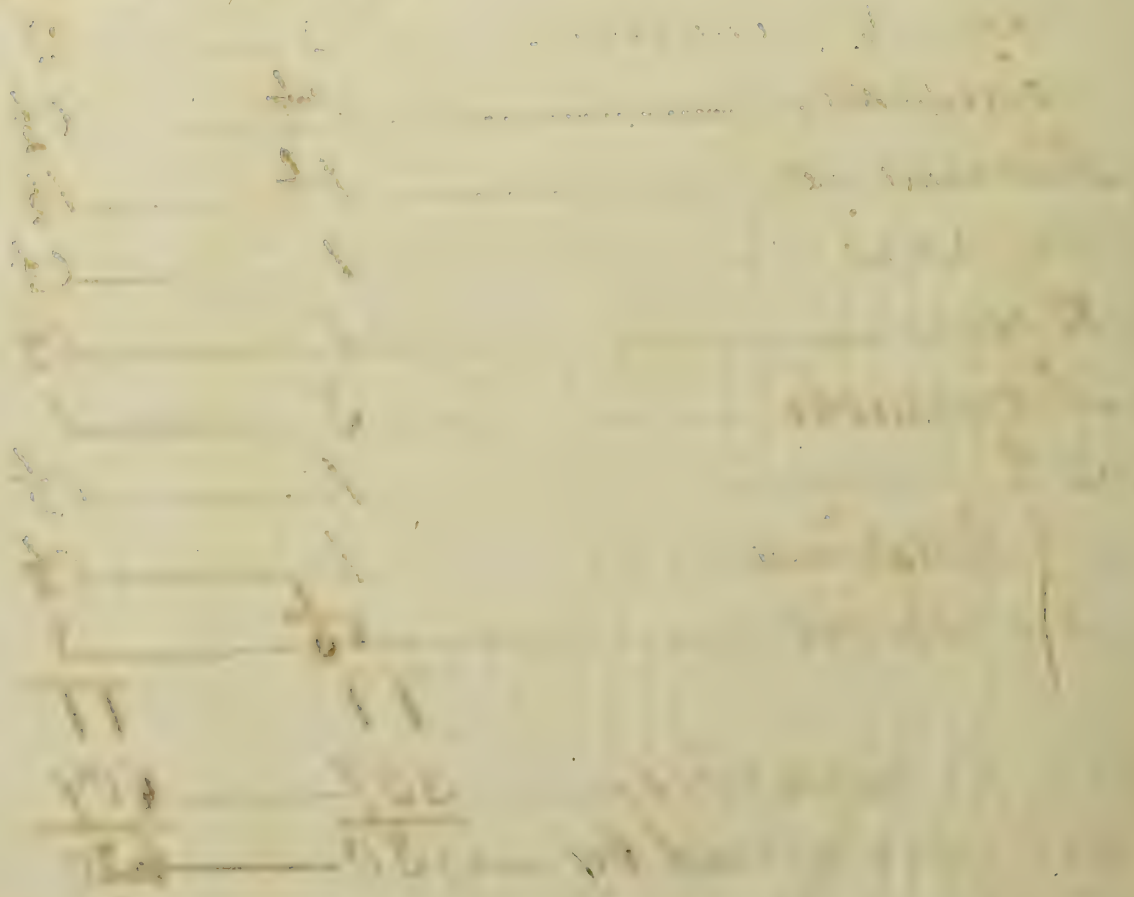




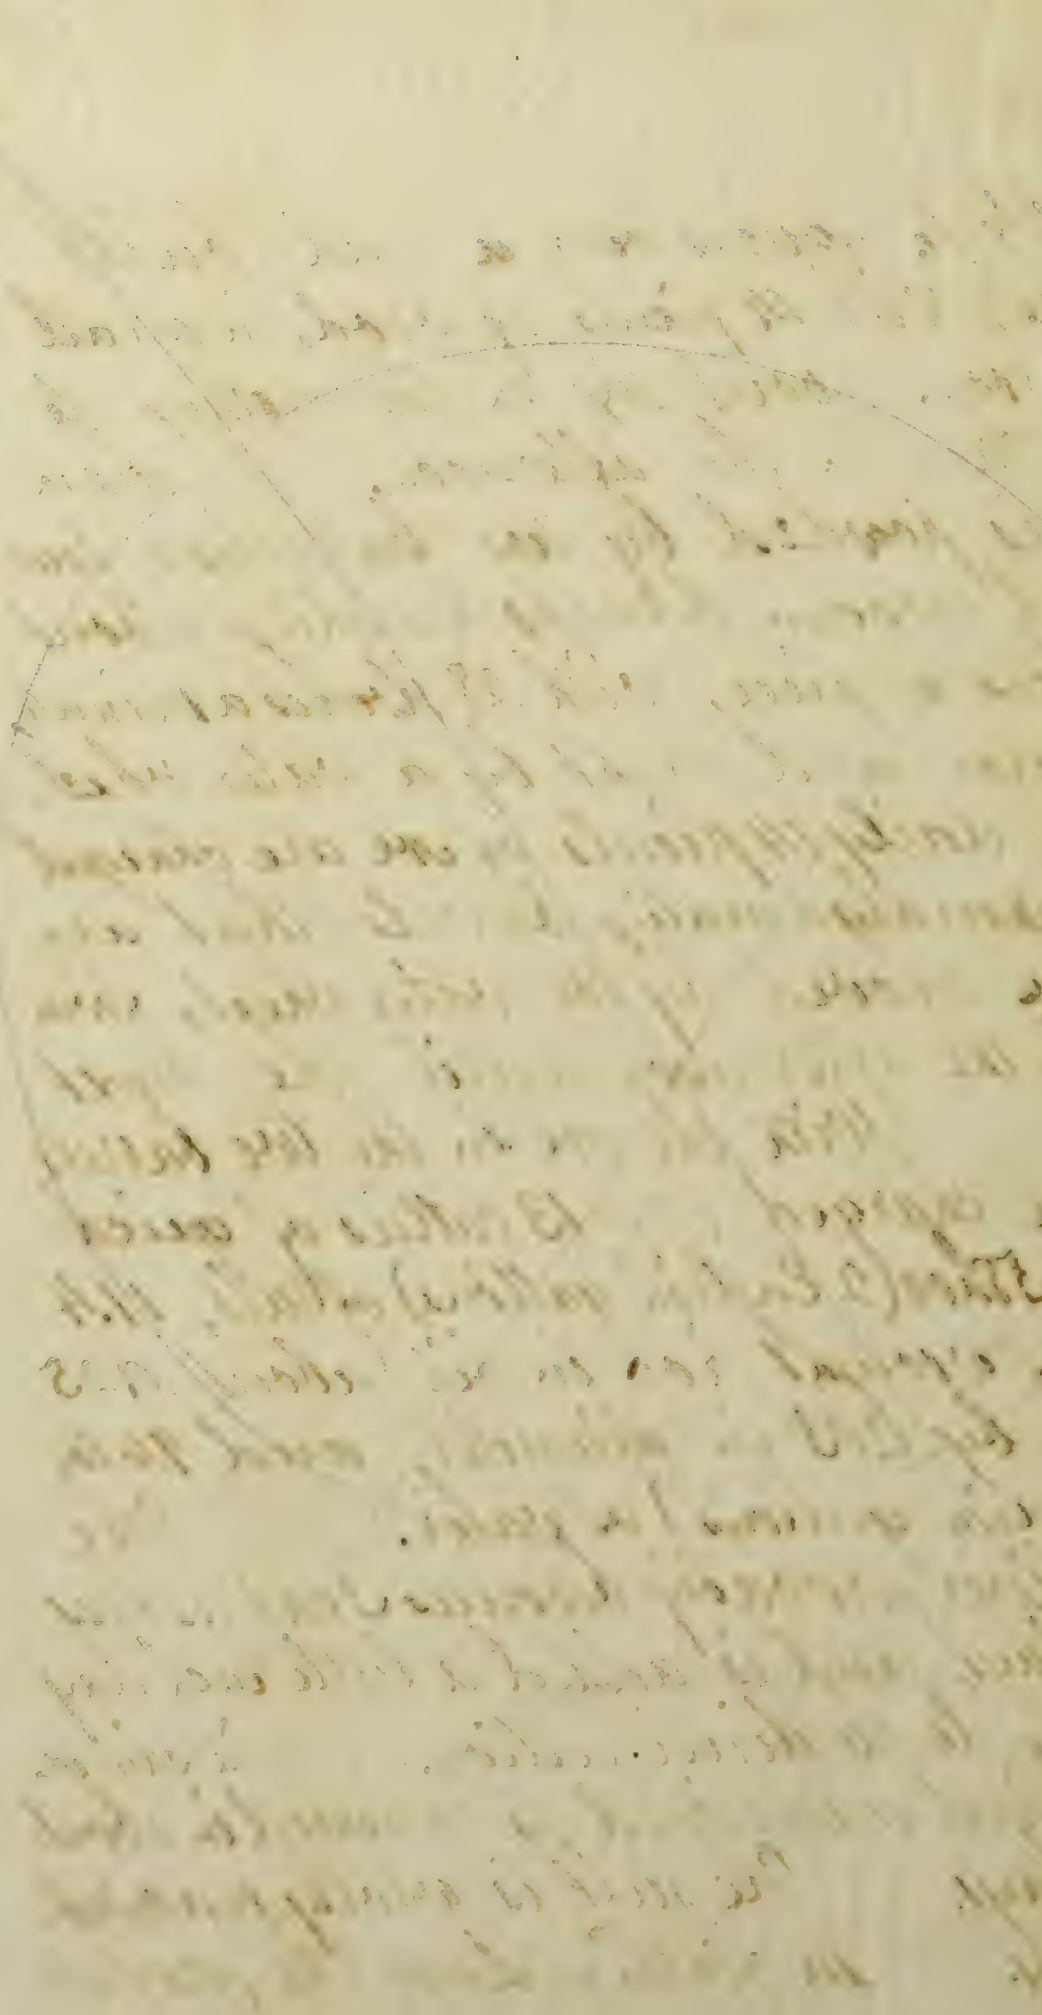
and beyond Imabu lu, the principal town of the region.



We could get no very definite information
about the Hugo copper mines. Apparently no system are worked, but do not flourish.



Washington



to Kagoshima

Plan the one is constituted of two batteries of four iron pots named Carnes Lime about 30 cattles apiece, with 24 strokes a minute round day and night by a water wheel. Plan No 2 is erected with 5 mos (English gallons) pots in one battery four pots about 3 ft square over a cast iron arch with 14 pistols a head, one small size, stone stood by in the morning & stood three in the afternoon. Plan No 3 daily by pistols & are charged in two amalgamating barrels each pots like are moved by the water wheel, from 12 in the afternoon until the next noon. With 3 ore in the two barrels there are charged 12 or 13 cattles quicksilver, 11.4 cattles charged iron in bits about 0.25 ft. on by 0.05 in diameter and 96 lbs (38 mos English gallons) of water. The quicksilver usually requires 3 cattles in ten days, and is added a little each day according to the diminution. The charge of iron just mentioned is renewed in about thirty days. In fifteen days the product

24 hours. Then in each of the other two necessarily more or less and to the top being about one hour there are charged eight pounds of meal (about 0.15 pt. in diameter) weighing (when 20 cubic inches is made, and measuring 3.4 ft. in circumference, evenly packed) several less than two cubic feet. The wood a little more or less than two pounds weight and eight ozs. The [illegible] is completed in about 24 hours. Then the heat is all closed down the [illegible] meal and on more nights that is a day and a half. Fermentation employed baking (August) three of the large vessels, viz. one in the boiler in about three hours, and five of the smaller ones in each of the upper rooms in half an hour, necessarily beginning at 4 p.m. in the morning and ending about noon. The cooking begins after the fire in the brick oven has cooled out before the opening of the [illegible]

Bird, bird of every variety conceivable, though
apparently the most common is all the time
screeching. There were also several species
of parrots and other tropical birds
from Paraiba down, especially in Pernambuco
and Ceara. We were told also of a
small bear, perhaps between middle-sized
a monkey of a more than the size and
spotted brown & gray & quite large
in Mundahau village, Paraiba province.
The snakes (land, water and other) are
very few and some of them are
very dark and are much used for medicine
they are supposed to be of the
most powerful kind. The
said that the Indians would
go to him that the bark was powerful
when used in the sea water. Mr. Fox
said, who has been studying and classifying
the botany of Brazil, a history of the trees and
and its cultivation and manufacture in
Pernambuco, has visited in his own district
of the Province and has found, and
[illegible] so far as known. He said

[illegible] would [illegible] population [illegible] a [illegible] [illegible] [illegible]

Doubtless of the coal seams formerly

May 16th.

The Mountains have continued generally by a sandy road through wide plains covered with grass, with a few scattering trees principally on the creeks. Some of the rocks are of a dark blue limestone and others of sandstone, and after travelling 18 miles encamped at the Falls near Nebraska, at which the river is 15 rods wide and 15 feet deep. Latitude 42° 15' North 38° East of Sacramento, about eight leagues, which we passed down quickly being propelled by a current of about four miles per hour. The Mountains are gradually left in the distance, and the country becomes more level. Musquitoes, low & the Steamer is drawn up to the bank where there is wood, and the whole company employed in cutting it, and filling the boilers. Some of the Indians have been around the camp all day, and appear friendly. We have left the Mountains behind us, and the country is level and fertile.

[illegible] mines is not without a [illegible]
[illegible]. The country rock [illegible] is
[illegible] [illegible] [illegible] and, [illegible]
of many [illegible] [illegible] a [illegible] split [illegible].
